

## CHAPITRE 2. PRINCIPALES METHODES DE MICROSCOPIE

### Exercices (bis)

1. Quel est le potentiel électrique généré par un dipôle lorsqu'il est étendu au premier ordre dans le vecteur dipolaire? (What is the electric potential generated by a dipole when expanded to first order in the dipole vector?)
2. (Cet exercice n'est pas obligatoire!) What is the induced dipole of a dielectric sphere of permittivity  $\epsilon$  in a static electric field that goes to  $\mathbf{E} = E_0 \hat{\mathbf{z}}$  far from the dipole? (Solve Laplace's equation inside and outside the sphere and match across the surface. Make any necessary expansions to get a simple result.)
3. Fill in the missing steps in the last slide on optical tweezers (i.e. derive the two expressions for  $F_{total}$  on slide number 69).
