Théorème fondamental du DFT

N. D. Mermin, Phys. Rev. 137, A1441 (1965).

1. La relation entre densité et champ est un à un et, donc, inversible:

$$\rho(\mathbf{r};[\phi]) \Leftrightarrow \phi(\mathbf{r};[\rho])$$

2. La distribution est une fonctionnel de la densité $f_N(\Gamma;[\phi]) \rightarrow f_N(\Gamma;[\rho])$

3. Il y a un fonctionnel $\Omega[\rho, \phi_0] \equiv \Lambda[\phi[\rho], \phi_0]$ et car $\Lambda[\phi, \phi_0] \geq \Lambda[\phi_0, \phi_0]$

$\Omega[\rho, \phi_0]$ est minimisée par $\rho = \rho_0 \equiv \rho[\phi_0]$

4. $\Omega[\rho_0, \phi_0] = \Omega[\phi_0]$

5. $\Omega[\rho, \phi_0] = F[\rho] + \int (\phi_0(\mathbf{r}) - \mu) \rho(\mathbf{r}) d\mathbf{r}$ où "F" est indépendant du champ.

Euler-Lagrange equation:

$$0 = \frac{\delta \Omega[\rho, \phi_0]}{\delta \rho(\mathbf{r})} = \frac{\delta F[\rho]}{\delta \rho(\mathbf{r})} + \phi_0(\mathbf{r}) - \mu$$

Density Functional Theory

 - Applications

Digression: des quantites du mecanique statistique

1. La distribution un particule est la densite locale:

$$f_N^{(N)}(\Gamma^{(N)}; [\phi]) = \frac{1}{Z[\phi] N! h^{ND}} \exp(-\beta H^{(N)})$$

$$f_{N-1}^{(N)}(\Gamma^{(N-1)}|\phi) = \int f_N^{(N)}(\Gamma^{(N)}|\phi) d\mathbf{x}_N, \quad d\mathbf{x}_N \equiv d\mathbf{q}_N d\mathbf{p}_N$$

$$f_{N-2}^{(N)}(\Gamma^{(N-2)}|\phi) = \int f_N^{(N)}(\Gamma^{(N)}|\phi) d\mathbf{x}_{N-1} d\mathbf{x}_N$$

\vdots

$$f_1^{(N)}(\mathbf{x}_1|\phi) = \int f_N^{(N)}(\Gamma^{(N)}|\phi) d\mathbf{x}_2 \dots d\mathbf{x}_N$$

$$\left(\frac{N}{V}\right)^2 g_2^{(N)}(\mathbf{q}_1, \mathbf{q}_2|\phi) = \int f_2^{(N)}(\mathbf{x}_1, \mathbf{x}_2|\phi) d\mathbf{p}_1 d\mathbf{p}_2$$

$$\frac{N}{V} g_1^{(N)}(\mathbf{q}_1|\phi) = \int f_1^{(N)}(\mathbf{x}_1|\phi) d\mathbf{p}_1$$

$$\hat{\rho}(\mathbf{r}) = \sum_{i=1}^N \delta(\mathbf{r} - \mathbf{q}_i)$$

$$\rho(\mathbf{r}) \equiv \langle \hat{\rho}(\mathbf{r}) \rangle = \sum_{N=0}^{\infty} \frac{Z_N[\phi]}{\Xi[\phi]} \exp(\beta \mu) \frac{N}{V} g_1^{(N)}(\mathbf{r}) \quad \xrightarrow{\text{canonique}} \quad \rho(\mathbf{r}) = \frac{N}{V} g_1^{(N)}(\mathbf{r})$$

La probabilité de trouver une particule à la position \mathbf{r}

Digression: des quantites du mecanique statistique

2. La distribution deux particule (canonique):

$$\frac{N(N-1)}{V^2} g_2^{(N)}(\mathbf{q}_1, \mathbf{q}_2 | \phi) = \frac{N(N-1)}{V^2} \int f_2^{(N)}(\mathbf{x}_1, \mathbf{x}_2 | \phi) d\mathbf{p}_1 d\mathbf{p}_2 = \langle \hat{\rho}(\mathbf{q}_1) \hat{\rho}(\mathbf{q}_2) \rangle - \langle \hat{\rho}(\mathbf{q}_1) \rangle \delta(\mathbf{q}_1 - \mathbf{q}_2)$$

4. Direct correlation function

Definissez

$$g_2^{(N)} - 1$$

$$\frac{\delta \rho(\mathbf{r} | \phi)}{\delta \beta \phi(\mathbf{r}')} = \langle \hat{\rho}(\mathbf{r}) \hat{\rho}(\mathbf{r}') \rangle - \langle \hat{\rho}(\mathbf{r}) \rangle \langle \hat{\rho}(\mathbf{r}') \rangle \equiv \langle \hat{\rho}(\mathbf{r}) \rangle \delta(\mathbf{r} - \mathbf{r}') + \langle \hat{\rho}(\mathbf{r}) \rangle \langle \hat{\rho}(\mathbf{r}') \rangle \underline{h(\mathbf{r}, \mathbf{r}' | \phi)}$$

$$\frac{\delta \beta \phi(\mathbf{r} | \rho)}{\delta \rho(\mathbf{r}')} \equiv - \frac{1}{\langle \hat{\rho}(\mathbf{r}) \rangle} \delta(\mathbf{r} - \mathbf{r}') + \underline{\Gamma(\mathbf{r}, \mathbf{r}' | \rho)}$$

DFT: des quantites du mecanique statistique

4. Direct correlation function

$$\frac{\delta \rho(\mathbf{r}|\beta\phi)}{\delta \phi(\mathbf{r}')} \equiv \langle \hat{\rho}(\mathbf{r}) \rangle \delta(\mathbf{r}-\mathbf{r}') + \langle \hat{\rho}(\mathbf{r}) \rangle \langle \hat{\rho}(\mathbf{r}') \rangle h(\mathbf{r}, \mathbf{r}'|\rho);$$

$$\frac{\delta \beta \phi(\mathbf{r}|\rho)}{\delta \rho(\mathbf{r}')} \equiv -\frac{1}{\langle \hat{\rho}(\mathbf{r}) \rangle} \delta(\mathbf{r}-\mathbf{r}') + \Gamma(\mathbf{r}, \mathbf{r}'|\rho)$$

$$\delta(\mathbf{r}-\mathbf{r}'') = \int \frac{\delta \rho(\mathbf{r}|\phi)}{\delta \phi(\mathbf{r}')} \frac{\delta \phi(\mathbf{r}'|\rho)}{\delta \rho(\mathbf{r}'')} d\mathbf{r}' \Rightarrow h(\mathbf{r}, \mathbf{r}'') = \Gamma(\mathbf{r}, \mathbf{r}'') + \int h(\mathbf{r}, \mathbf{r}') \rho(\mathbf{r}') \Gamma(\mathbf{r}', \mathbf{r}'') d\mathbf{r}'$$

“Ornstein-Zernike equation”

Euler-Lagrange:

$$0 = \frac{\delta F[\rho]}{\delta \rho(\mathbf{r})} + \phi(\mathbf{r}) - \mu \Rightarrow \phi(\mathbf{r}|\rho) = \mu - \frac{\delta F[\rho]}{\delta \rho(\mathbf{r})}$$

$$\Rightarrow \frac{\delta \beta \phi(\mathbf{r}|\rho)}{\delta \rho(\mathbf{r}')} = -\frac{\delta^2 \beta F[\rho]}{\delta \rho(\mathbf{r}) \delta \rho(\mathbf{r}')}$$

$$\Rightarrow \frac{\delta^2 \beta F[\rho]}{\delta \rho(\mathbf{r}) \delta \rho(\mathbf{r}')} = -\Gamma(\mathbf{r}, \mathbf{r}'|\rho) + \frac{1}{\rho(\mathbf{r})} \delta(\mathbf{r}-\mathbf{r}')$$

DFT: lien entre la fonctionnelle d'energie et la structure.

Direct correlation function

$$\frac{\delta^2 \beta F[\rho]}{\delta \rho(\mathbf{r}) \delta \rho(\mathbf{r}')} = -\Gamma(\mathbf{r}, \mathbf{r}' | \rho) + \frac{1}{\langle \hat{\rho}(\mathbf{r}) \rangle} \delta(\mathbf{r} - \mathbf{r}')$$

En generale si $\frac{\delta \beta F[\rho]}{\delta \rho(\mathbf{r})} = c_1(\mathbf{r} | \rho)$ et si $\frac{\delta c_1(\mathbf{r}_1 | \rho)}{\delta \rho(\mathbf{r}_2)} = \frac{\delta c_1(\mathbf{r}_2 | \rho)}{\delta \rho(\mathbf{r}_1)}$

il s'ensuite que $\beta F[\rho_1] - \beta F[\rho_0] = \int_0^1 d\lambda \int d\mathbf{r} \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} c_1(\mathbf{r} | \rho_\lambda)$

pour tout parametrization, e.g. $\rho_\lambda(\mathbf{r}) = \rho_0(\mathbf{r}) + \lambda(\rho_1(\mathbf{r}) - \rho_0(\mathbf{r}))$

Voire, e.g. T. Frankel, *The Geometry of Physics*, Cambridge University Press, Cambridge, UK, 1997.

Donc,

$$\begin{aligned} \beta F[\rho_1] - \beta F[\rho_0] &= \int_0^1 d\lambda \int d\mathbf{r} \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} c_1(\mathbf{r} | \rho_\lambda) \\ &\quad - \int_0^1 d\lambda \int_0^\lambda d\lambda' \int d\mathbf{r} d\mathbf{r}' \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} \frac{\partial \rho_{\lambda'}(\mathbf{r}')}{\partial \lambda'} \left(\Gamma(\mathbf{r}, \mathbf{r}' | \rho_{\lambda'}) - \frac{1}{\rho_{\lambda'}(\mathbf{r})} \delta(\mathbf{r} - \mathbf{r}') \right) \end{aligned}$$

Digression: dans une fluide avec pair-interactions et symetrie spherique

1. Dans l'etat fluide (liquide ou gaz) et sans champ exterieur $\rho(\mathbf{r}) \equiv \bar{\rho} = \frac{N}{V}$
(exercice)

2. Pair correlation function

$$g_2^{(N)}(\mathbf{q}_1, \mathbf{q}_2 | \Phi) \rightarrow g_2^{(N)}(|\mathbf{r}_1 - \mathbf{r}_2|; \bar{\rho}) = 1 + h_2^{(N)}(|\mathbf{r}_1 - \mathbf{r}_2|; \bar{\rho})$$

“pair correlation function”

“structure function”

3. Ornstein-Zernike equation

$$h(r_{12}; \bar{\rho}) = c(r_{12}; \bar{\rho}) + \bar{\rho} \int h(r_{13}; \bar{\rho}) c(r_{32}; \bar{\rho}) d\mathbf{r}_3$$

“direct correlation function”

4. Liquid-state theory: $c(r) = (1 - e^{\beta U(r)}) g(r)$, Percus-Yevik
 $c(r) = g(r) - 1 - \ln g(r) - \beta U(r)$, Hypernetted-chain equation

(Diagrammatic resummations of cluster expansion.)

Les spheres dure: résoudre (PY)

Percus-Yevik:
$$c_{PY} = \begin{cases} a_0 + a_1 r + a_3 r^3, & r < d \\ 0, & r > d \end{cases}$$

$g_{HS}(r < d) = 0$

$$a_0 = -\frac{(1+2\eta)^2}{(1-\eta)^4}, \quad a_1 = \frac{3\eta}{2} \frac{(2+\eta)^2}{(1-\eta)^4}, \quad a_3 = \frac{\eta}{2} a_0$$

$$y(r) = e^{\beta U(r)} g(r)$$

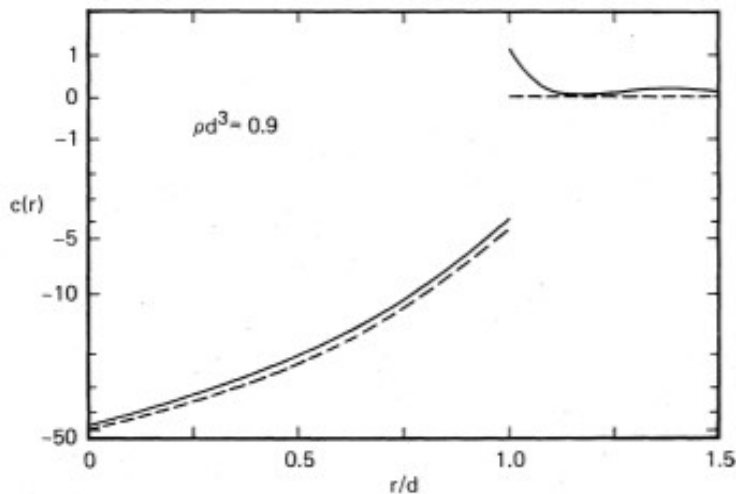

FIG. 18. Direct correlation function of hard spheres at $\rho d^3 = 0.9$. The solid curve gives the semiempirical results of Grundke and Henderson (1972) and the broken curve gives the PY results. The curve is plotted on a \sinh^{-1} scale. This pseudologarithmic scale combines the advantages of a logarithmic scale with the ability to display zero and negative quantities.

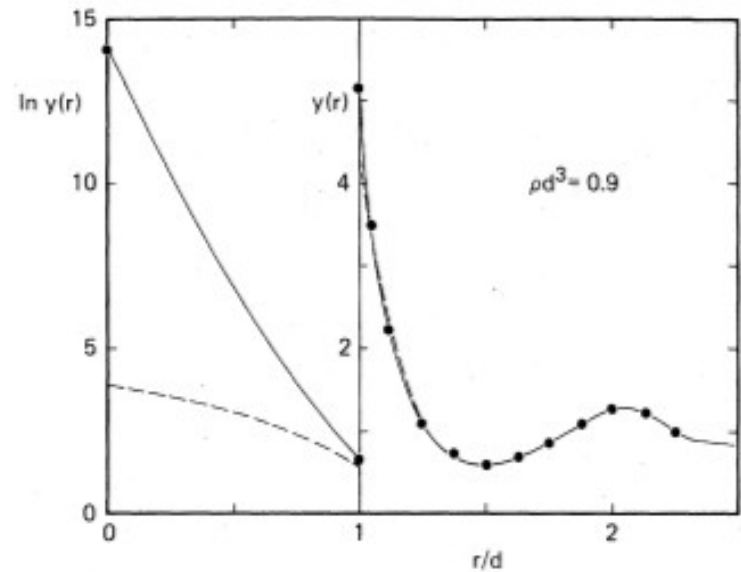

FIG. 17. $y(r)$ of hard spheres at $\rho d^3 = 0.9$. The points give the simulation results of Barker and Henderson (1971a, 1972) and the solid line gives the semiempirical results of Verlet and Wels (1972a) and Grundke and Henderson (1972) and the broken curve gives the PY results.

Density Functional Theory

- Introduction
- 0K DFT
- $T > 0$
 - Théorème fondamental du DFT
 - des quantités du mécanique statistique
 - **Gaz parfait**
 - Des modèles
 - Sphères Dures: FMT
 - Interactions de longue portée
 - Applications

DFT: gaz parfait

$$\begin{aligned}
 \Xi[\phi] &\equiv \exp(-\beta \Omega[\phi]) = \sum_{N=0}^{\infty} \frac{1}{N! h^{ND}} \int \exp(-\beta (H^{(N)} - \mu N)) d\Gamma^{(N)} \\
 &= \sum_{N=0}^{\infty} \frac{1}{N! h^{ND}} (2\pi k_B T)^{-DN/2} \left(\int \exp(-\beta (\phi(\mathbf{r}) - \mu)) d\mathbf{r} \right)^N \\
 &= \exp\left(\Lambda^{-D} \int e^{-\beta (\phi(\mathbf{r}) - \mu)} d\mathbf{r} \right) \qquad \Lambda \equiv \frac{h}{\sqrt{2\pi k_B T}}
 \end{aligned}$$

$$\Rightarrow \rho(\mathbf{r}|\phi) = \frac{\delta \Omega}{\delta \phi(\mathbf{r})} = \Lambda^{-D} \exp(-\beta (\phi(\mathbf{r}) - \mu)) \Leftrightarrow \phi(\mathbf{r}|\rho) = \mu + \ln \Lambda^D \rho(\mathbf{r})$$

Euler-Lagrange

$$\frac{\delta F_{id}[\rho]}{\delta \rho(\mathbf{r})} = \mu - \phi(\mathbf{r}|\rho) = k_B T \ln \Lambda^D \rho(\mathbf{r})$$

DFT: gaz parfait

$$\frac{\delta F_{id}[\rho]}{\delta \rho(\mathbf{r})} = \mu - \phi(\mathbf{r}|\rho) = k_B T \ln \Lambda^D \rho(\mathbf{r})$$

En generale si $\frac{\delta \beta F[\rho]}{\delta \rho(\mathbf{r})} = c_1(\mathbf{r}|\rho)$ et si $\frac{\delta c_1(\mathbf{r}_1|\rho)}{\delta \rho(\mathbf{r}_2)} = \frac{\delta c_1(\mathbf{r}_2|\rho)}{\delta \rho(\mathbf{r}_1)}$

ils ensuite que $\beta F[\rho_2] - \beta F[\rho_1] = \int_0^1 d\lambda \int d\mathbf{r} (\rho_2(\mathbf{r}) - \rho_1(\mathbf{r})) c_1(\mathbf{r}|\rho_1 + \lambda(\rho_2 - \rho_1))$

Donc, on trouve que

$$\beta F_{id}[\rho] = \int (\rho(\mathbf{r}) \ln(\Lambda^D \rho(\mathbf{r})) - \rho(\mathbf{r})) d\mathbf{r}$$

Density Functional Theory

- Introduction
- 0K DFT
- $T > 0$
 - Théorème fondamental du DFT
 - des quantités du mécanique statistique
 - Gaz parfait
 - Des modèles
 - Sphères Dures: FMT
 - Interactions de longue portée
 - Applications

DFT: Des modèles

$$\beta F_{id}[\rho] = \int \left(\rho(\mathbf{r}) \ln(\Lambda^D \rho(\mathbf{r})) - \rho(\mathbf{r}) \right) d\mathbf{r}$$

$$\begin{aligned} \beta F[\rho_1] - \beta F[\rho_0] = & \int_0^1 d\lambda \int d\mathbf{r} \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} c_1(\mathbf{r}|\rho_\lambda) \\ & - \int_0^1 d\lambda \int_0^\lambda d\lambda' \int d\mathbf{r} d\mathbf{r}' \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} \frac{\partial \rho_{\lambda'}(\mathbf{r}')}{\partial \lambda'} \left(\Gamma(\mathbf{r}, \mathbf{r}'|\rho_{\lambda'}) - \frac{1}{\rho_{\lambda'}(\mathbf{r})} \delta(\mathbf{r} - \mathbf{r}') \right) \end{aligned}$$

Si l'on définit $\beta F[\rho] = \beta F_{id}[\rho] + \beta F_{ex}[\rho]$

il s'ensuit que

$$\begin{aligned} \beta F_{ex}[\rho_1] = & \beta F_{ex}[\rho_0] + \int_0^1 d\lambda \int d\mathbf{r} \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} c_1(\mathbf{r}|\rho_\lambda) \\ & - \int_0^1 d\lambda \int_0^\lambda d\lambda' \int d\mathbf{r} d\mathbf{r}' \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} \frac{\partial \rho_{\lambda'}(\mathbf{r}')}{\partial \lambda'} \Gamma(\mathbf{r}, \mathbf{r}'|\rho_{\lambda'}) \end{aligned}$$

DFT: des modèles

Effective liquid models:

$$\begin{aligned} \beta F_{ex}[\rho_1] - \beta F_{ex}[\rho_0] = & \int_0^1 d\lambda \int d\mathbf{r} \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} c_1(\mathbf{r}|\rho_\lambda) \\ & - \int_0^1 d\lambda \int_0^1 d\lambda' \int d\mathbf{r} d\mathbf{r}' \frac{\partial \rho_\lambda(\mathbf{r})}{\partial \lambda} \frac{\partial \rho_{\lambda'}(\mathbf{r}')}{\partial \lambda'} c_2(\mathbf{r}, \mathbf{r}'|\rho_{\lambda'}) \end{aligned} \quad (\Gamma \rightarrow c_2)$$

$$\rho_0(\mathbf{r}) = \bar{\rho}_0 \quad F[\rho_0] \rightarrow V f(\bar{\rho}_0) \quad \rho_\lambda(\mathbf{r}) = \bar{\rho}_0 + \lambda(\rho_1(\mathbf{r}) - \bar{\rho}_0)$$

$$\begin{aligned} \beta \frac{1}{V} F_{ex}[\rho_1] = & \beta f_{ex}(\bar{\rho}_0) + \frac{\partial f_{ex}(\bar{\rho}_0)}{\partial \bar{\rho}_0} (\bar{\rho}_1 - \bar{\rho}_0) \\ & - \frac{1}{V} \int_0^1 d\lambda \int_0^1 d\lambda' \int d\mathbf{r} d\mathbf{r}' (\rho(\mathbf{r}) - \bar{\rho}_0)(\rho(\mathbf{r}') - \bar{\rho}_0) c_2(\mathbf{r}, \mathbf{r}'|\bar{\rho}_0 + \lambda(\rho_1 - \bar{\rho}_0)) \end{aligned}$$

DFT: des modeles de liquide efficaces

$$\frac{1}{V} \beta F_{ex}[\rho_1] = \beta f_{ex}(\bar{\rho}_0) + \frac{\partial f_{ex}(\bar{\rho}_0)}{\partial \bar{\rho}_0} (\bar{\rho}_1 - \bar{\rho}_0) - \frac{1}{V} \int_0^1 d\lambda \int_0^1 d\lambda' \int d\mathbf{r} d\mathbf{r}' (\rho(\mathbf{r}) - \bar{\rho}_0)(\rho(\mathbf{r}') - \bar{\rho}_0) c_2(\mathbf{r}, \mathbf{r}' | \bar{\rho}_0 + \lambda'(\rho_1 - \bar{\rho}_0))$$

Ramakrishnan–Yussouff: Ramakrishnan and Yussouff, Phys. Rev. B 19, 2775 (1979).

$$\bar{\rho}_0 = \bar{\rho}_1 \quad c_2(\mathbf{r}, \mathbf{r}' | \bar{\rho}_0 + (1 - \lambda)(\rho_1 - \bar{\rho}_0)) = c_2(|\mathbf{r} - \mathbf{r}'|; \bar{\rho}_0) + \dots$$

$$\frac{1}{V} \beta F_{ex}^{(RY)}[\rho_1] = \beta f_{ex}(\bar{\rho}_0) - \frac{1}{2V} \int d\mathbf{r} d\mathbf{r}' (\rho(\mathbf{r}) - \bar{\rho}_0)(\rho(\mathbf{r}') - \bar{\rho}_0) c_2(|\mathbf{r} - \mathbf{r}'|; \bar{\rho}_0)$$

Generalized Effective Liquid Approx. (GELA)

Lutsko and Baus, Phys. Rev. Lett. 64, 761 (1990); Phys. Rev. A 41, 6647 (1990).

$$\bar{\rho}_0 = 0 \quad c_2(\mathbf{r}, \mathbf{r}' | \bar{\rho}_0 + (1 - \lambda)(\rho_1 - \bar{\rho}_0)) = c_2(|\mathbf{r} - \mathbf{r}'|; \bar{\rho}(\lambda))$$

$$\frac{1}{V} \beta F_{ex}^{(GELA)}[\rho_1] = -\frac{1}{2V} \int_0^1 d\lambda (1 - \lambda) \int d\mathbf{r} d\mathbf{r}' \rho(\mathbf{r}) \rho(\mathbf{r}') c_2(|\mathbf{r} - \mathbf{r}'|; \bar{\rho}(\lambda))$$

$$\frac{1}{V \alpha \bar{\rho}_1} \beta F_{ex}^{(GELA)}(\alpha \bar{\rho}_1) = \frac{1}{\bar{\rho}_{GELA}(\alpha)} \beta f_{ex}(\bar{\rho}_{GELA}(\alpha))$$

DFT: des modeles

Modified Weighted Density Approx. (MWDA):

Denton and Ashcroft, Phys. Rev. A **39** 2909 (1985).

$$\frac{1}{\rho_1} V \beta F_{ex}^{(MWDA)}[\rho] = \frac{1}{\rho_{MWDA}} V \beta F_{ex}(\rho_{MWDA}[\rho])$$

$$\lim_{\rho(r) \rightarrow \bar{\rho}} \frac{\delta^2 \beta F_{ex}^{(MWDA)}}{\delta \rho(\mathbf{r}_1) \delta \rho(\mathbf{r}_2)} = -c(r_{12}; \bar{\rho})$$

$$\Rightarrow \rho_{MWDA}[\rho] = \frac{1}{\bar{\rho} V} \int w(r_{12}; \rho_{MWDA}[\rho]) \rho(\mathbf{r}_1) \rho(\mathbf{r}_2) d\mathbf{r}_1 d\mathbf{r}_2$$

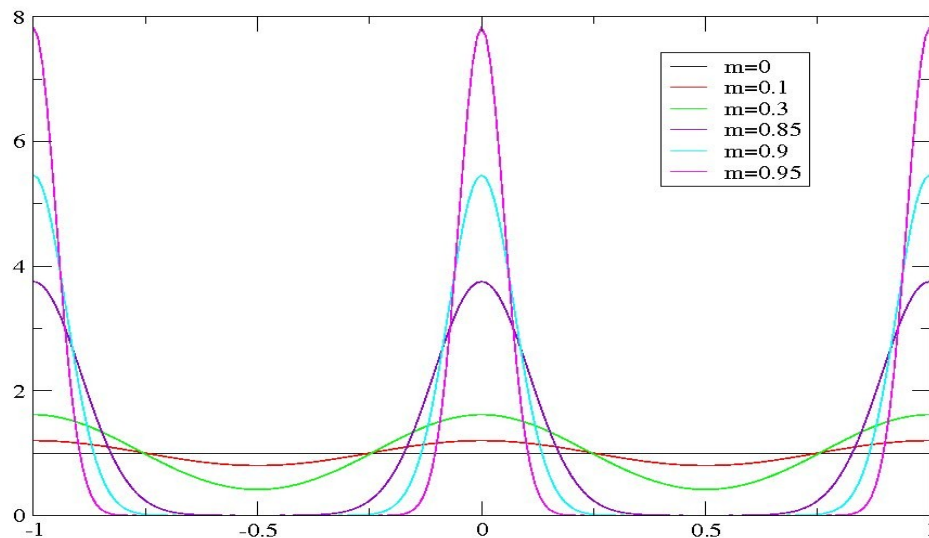

$$w(r, \rho) = \frac{-1}{2\beta \psi'(\rho)} \left(c_2(r_{12}; \rho) + \frac{1}{V} \rho \beta \psi''(\rho) \right), \quad \psi(\rho) = \frac{1}{\bar{\rho}} f_{ex}(\rho) = \frac{1}{\rho V} F_{ex}(\rho)$$

(exercise)

DFT: solides

$$\rho(\mathbf{r}) = \left(\frac{\alpha}{\pi}\right)^{3/2} \sum_{\mathbf{R}_i \in \text{lattice vectors}} \exp(-\alpha(\mathbf{r} - \mathbf{R}_i)^2)$$

$$\begin{aligned} \rho(\mathbf{r}) &= \bar{\rho} + \bar{\rho} \sum_{\mathbf{K}_i \in \text{recip lattice}} \exp(i\mathbf{K}_i \cdot \mathbf{r}) \exp(-K_i^2/(4\alpha)) \\ &= \bar{\rho} + \bar{\rho} \sum_{\mathbf{K}_i \in \text{recip lattice}} \exp(i\mathbf{K}_i \cdot \mathbf{r}) \chi^{(K_i/K_1)^2}, \quad \chi = \exp(-K_1^2/(4\alpha)) \text{ "crystallinity"} \end{aligned}$$

Density Functional Theory

- Introduction
- 0K DFT
- $T > 0$
 - Théorème fondamental du DFT
 - des quantités du mécanique statistique
 - Gaz parfait
 - Des modèles
 - Sphères Dures: FMT
 - Interactions de longue portée
 - Applications

Hard spheres in 1D: hard rods (barres dures)

$$F[\rho] = F_{id}[\rho] - \int_{-\infty}^{\infty} \frac{1}{2} (\rho(x+d/2) + \rho(x-d/2)) \ln \left(1 - \int_{-d/2}^{d/2} \rho(x+y) dy \right) dx \quad (\text{Exact})$$

Percus, J. Stat. Phys **15**, 505 (1976)

Sphères Dures: FMT

Fundamental Measure Theory (FMT): Généralisation du résultat de Percus à plusieurs dimensions.

Ansatz:

$$F_{ex}[\rho] = \int \Phi(\{n_\alpha(\mathbf{r})\}) d\mathbf{r}$$

$$n_\alpha(\mathbf{r}|\rho) = \int w_\alpha(|\mathbf{r} - \mathbf{r}'|) \rho(\mathbf{r}') d\mathbf{r}'$$

Percus:

$$F[\rho] = F_{id}[\rho] - \int_{-\infty}^{\infty} \frac{1}{2} (\rho(x+d/2) + \rho(x-d/2)) \ln \left(1 - \int_{-d/2}^{d/2} \rho(x+y) dy \right) dx$$

$$\Phi(\{n_\alpha(\mathbf{r})\}) = s(x) \ln(1 - \eta(x))$$

$$w_s(|x - x'|) = \delta((d/2) - |x - x'|)$$

$$w_s(|x - x'|) = \Theta((d/2) - |x - x'|)$$

Rosenfeld: ansatz + “scaled particle theory”

Y. Rosenfeld, Phys. Rev. Lett. **63**, 980 (1989).

Sphères Dures: FMT

$$F_{ex}[\rho] = \int \Phi(\{n_\alpha(\mathbf{r})\}) d\mathbf{r}$$

$$n_\alpha(\mathbf{r}|\rho) = \int w_\alpha(\mathbf{r} - \mathbf{r}') \rho(\mathbf{r}') d\mathbf{r}'$$

Kierlik and M. L. Rosinberg: insiste que

$$\lim_{\rho(\mathbf{r}) \rightarrow \bar{\rho}} \frac{\delta^2 \beta F^{(FMT)}[\rho]}{\delta \rho(\mathbf{r}) \delta \rho(\mathbf{r}')} = -c_2^{(PY)}(|\mathbf{r} - \mathbf{r}'|; \bar{\rho})$$

E. Kierlik and M. L. Rosinberg, Phys. Rev. A **42**, 3382 (1990).

$$\lim_{\rho(\mathbf{r}) \rightarrow \bar{\rho}} \frac{\delta^2 \beta F^{(FMT)}[\rho]}{\delta \rho(\mathbf{r}) \delta \rho(\mathbf{r}')} = \frac{\partial^2 \Phi(\{n_\alpha(\mathbf{r})\})}{\partial n_\alpha \partial n_\beta} \sum_{\alpha, \beta} \int w_\alpha(\mathbf{r} - \mathbf{r}'') w_\beta(\mathbf{r}' - \mathbf{r}'') d\mathbf{r}''$$

Rosenfeld et Kierlik & Rosinberg sont équivalents:

$$\Phi = -\frac{1}{\pi d^2} s \ln(1 - \eta) + \frac{1}{2\pi d} \frac{s^2 - v^2}{(1 - \eta)} + \frac{1}{24\pi} \frac{s^3 - 3sv^2}{(1 - \eta)^2}$$

$$w_\eta(\mathbf{r}) = \Theta\left(\frac{d}{2} - r\right), \quad w_s(\mathbf{r}) = \delta\left(\frac{d}{2} - r\right), \quad w_v(\mathbf{r}) = \hat{\mathbf{r}} \delta\left(\frac{d}{2} - r\right)$$

Sphères Dures: FMT

$$F_{ex}[\rho] = \int \Phi(\{n_\alpha(\mathbf{r})\}) d\mathbf{r}$$

$$n_\alpha(\mathbf{r}|\rho) = \int w_\alpha(\mathbf{r} - \mathbf{r}') \rho(\mathbf{r}') d\mathbf{r}'$$

Probleme: Rosenberg FMT ne se stabilise pas le solide.

Solution: après beaucoup de travail, exiger des limites plus précises.

(Pour exemple: une cavité qui peut contenir au plus deux boules.) (exercice)

Afin de satisfaire à toutes les exigences, on a besoin des densités tensorielles:

$$w_T(\mathbf{r}) = \hat{\mathbf{r}} \hat{\mathbf{r}} \delta\left(\frac{d}{2} - r\right)$$

$$\Phi_3 = \frac{1}{24\pi} \frac{s^3 - 3sv^2}{(1-\eta)^2} \rightarrow \frac{3}{16\pi(1-\eta)^2} \left(\mathbf{v} \cdot \mathbf{T} \cdot \mathbf{v} - sv^2 - \text{Tr}(\mathbf{T}^3) + s \text{Tr}(\mathbf{T}^2) \right)$$

P. Tarazona, Phys. Rev. Lett. **84**, 694 (2000).

Sphères Dures: FMT

Probleme: Le description de gel de hard-sphere n'etait pas bonne.

Raison: Percus-Yevik pas precise a haut densitie.

Solution: modification heuristique de Tarazona fonctionnel appelé "White Bear".

R. Roth, R. Evans, A. Lang, and G. Kahl, J. Phys. Condens. Matter **14**, 12063 (2002).

TABLE II
Comparison of the Predictions of Various FMT DFTs for the Freezing of Hard Spheres to Data from Simulation^a

Theory	EOS	$\bar{\eta}_{\text{liq}}$	$\bar{\eta}_{\text{sol}}$	P^*	L
RSLT ^b	PY	0.491	0.540	12.3	1.06
Tarazona ^c	PY	0.467	0.516	9.93	0.145
White Bear ^{c,d}	CS	0.489	0.536	11.3	0.132
MC ^e	—	0.494	0.545	11.7	0.126

^aGiven are the liquid, $\bar{\eta}_{\text{liq}}$, and solid, $\bar{\eta}_{\text{sol}}$, packing fractions, the reduced pressure $P^* = \beta P d^3$ and the Lindemann parameter, L , at bulk coexistence. For each theory, the equation of state used for the fluid, Percus–Yevick(PY) or Carnahan–Starling (CS), is indicated. The Lindemann ratio for all three theories, calculated in the Gaussian approximation, is taken from Ref. 81.

Density Functional Theory

- Introduction
- 0K DFT
- $T > 0$
 - Théorème fondamental du DFT
 - des quantités du mécanique statistique
 - Gaz parfait
 - Des modèles
 - Sphères Dures: FMT
 - Interactions de longue portée
 - Applications

Interactions de longue portée

Modele moyenne-champ (ou, parfois “van der Waals”):

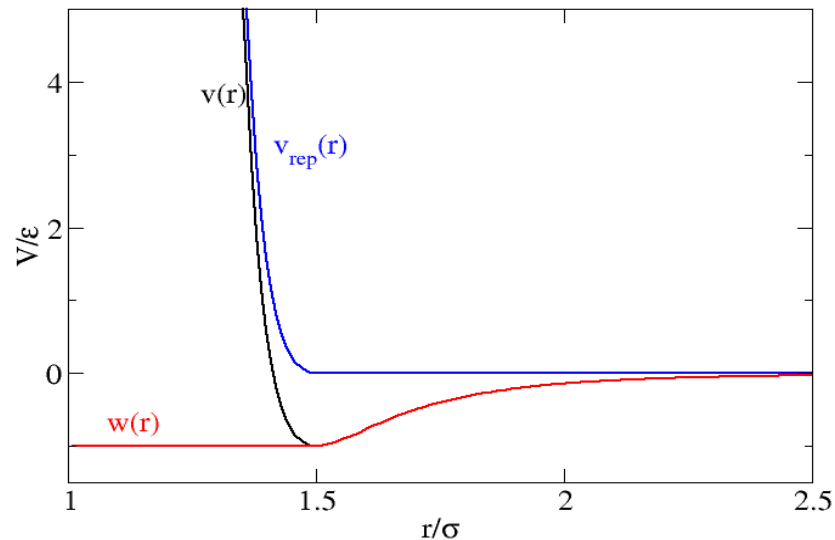

$$v(r) = v_{rep}(r) + w(r)$$

$$F_{ex}[\rho] = F_{ex}^{HS}(d_{eff}|\rho) + \frac{1}{2} \int \rho(\mathbf{r}) \rho(\mathbf{r}') w(\mathbf{r} - \mathbf{r}') d\mathbf{r} d\mathbf{r}'$$

partie répulsive

partie attractive

$$d_{eff} = \int_0^{r_0} (1 - \exp(-\beta v_{rep}(r))) d\mathbf{r}$$

Interactions de longue portée

Plus simple:

$$F_{ex}[\rho] = F_{ex}^{HS}(d_{eff}|\rho) + V(f_{ex}(\bar{\rho}) - f_{ex}^{HS}(\bar{\rho}; d_{eff}))$$

$$F_{ex}[\rho] = F_{ex}^{HS}(d_{eff}|\rho) + \int (f_{ex}(\rho(\mathbf{r})) - f_{ex}^{HS}(\rho(\mathbf{r}); d_{eff})) d\mathbf{r}$$

$$F_{ex}[\rho] = \int f_{ex}(\rho(\mathbf{r})) d\mathbf{r} \quad \text{“local density model”}$$

$$F_{ex}[\rho] = \int (f_{ex}(\rho(\mathbf{r})) + K(\nabla \rho(\mathbf{r}))^2) d\mathbf{r} \quad \begin{array}{l} \text{“van der Waals' model”} \\ \text{or “squared-gradient model”} \end{array}$$

Plus complexe et précise:

$$F_{ex}[\rho] = F_{ex}^{HS}(d_{eff}|\rho) + F_{ex}^{core}(d_{eff}|\rho) + \frac{1}{2} \int \rho(\mathbf{r}) \rho(\mathbf{r}') w(\mathbf{r} - \mathbf{r}') d\mathbf{r} d\mathbf{r}'$$

Pour l'application de certaines propriétés de la dcf;
formulées comme FMT

TABLE III. The order parameter profile parameters obtained by minimizing the free energy. The profiles studied are the hyperbolic tangents with $B_m=B_\rho$ (H), the “offset” hyperbolic tangents where $B_m \neq B_\rho$ (OH), and the hyperbolic tangents with a Gaussian term (HG). Also included are the results from MD simulations of Ref. [35] and the MC simulations of Ref. [36]. In all cases, the last column gives the surface tension.

Theory	Profile	A_m	A_ρ	B_ρ	C_ρ	D_ρ	E_ρ	$\gamma\sigma^2/k_B T$
RSLT	H	0.63	0.82					0.757
RSLT	OH	0.69	1.64	-0.71				0.689
RSLT	HG	0.73	1.00		-0.043	1.48	0.02	0.685
WB	H	0.75	0.84					0.759
WB	OH	0.86	2.56	-0.78				0.662
WB	HG	0.92	1.72		-0.064	2.19	-0.19	0.658
MD								0.617
MC								0.623

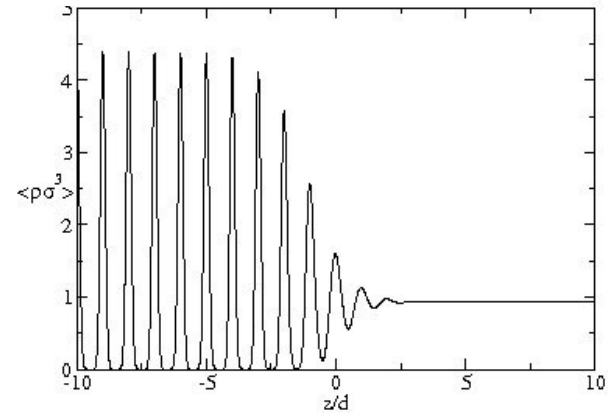

FIG. 3: The atomic density averaged over planes perpendicular to the interface as a function of position, calculated using the RSLT theory and the offset hyperbolic tangent parameterization. The position is shown in units of the interplanar spacing for [100] planes, $d = 0.5a$ where a is the lattice parameter.

Lutsko, Phys. Rev. E **74**, 021603 (2006).

Applications: Problems with Hard-Spheres

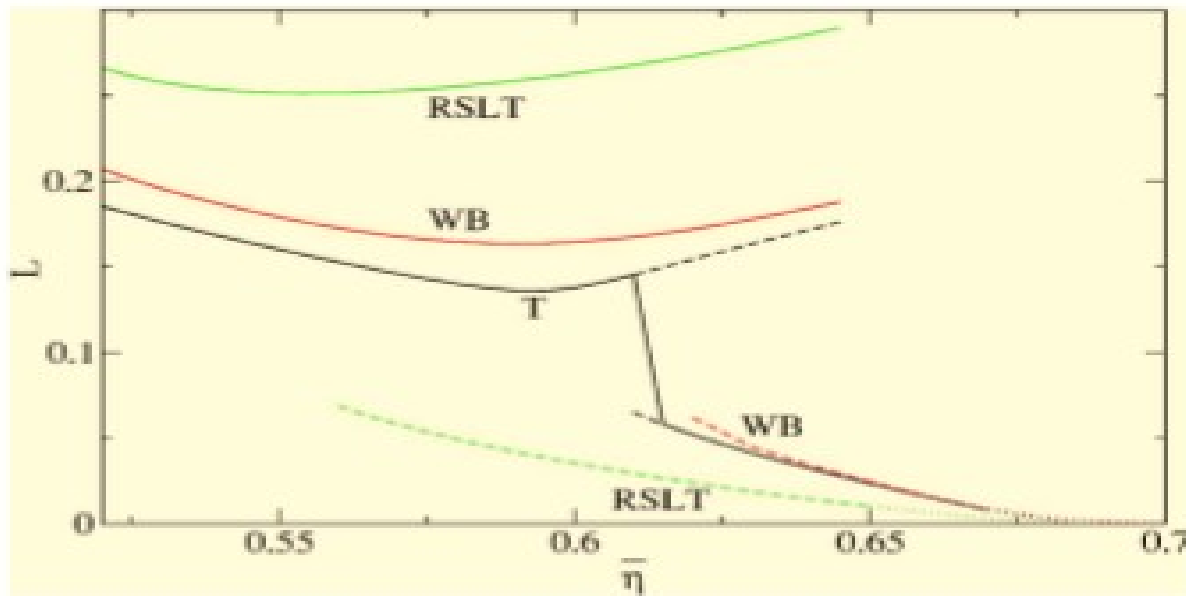

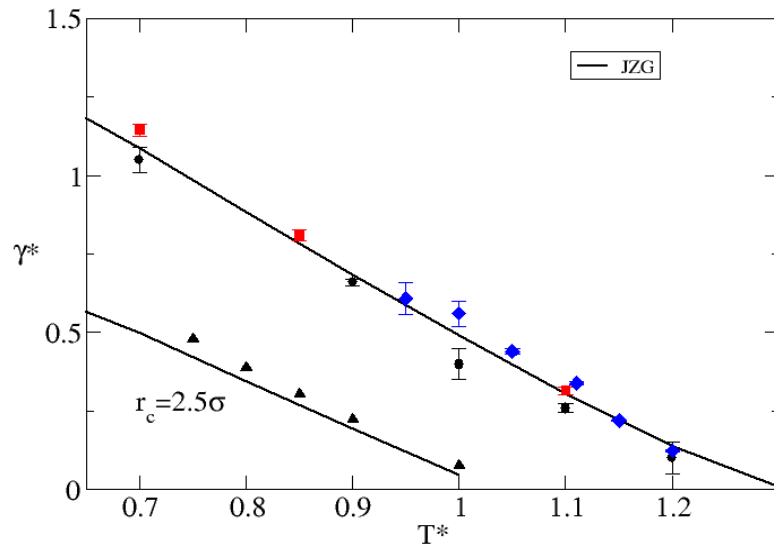

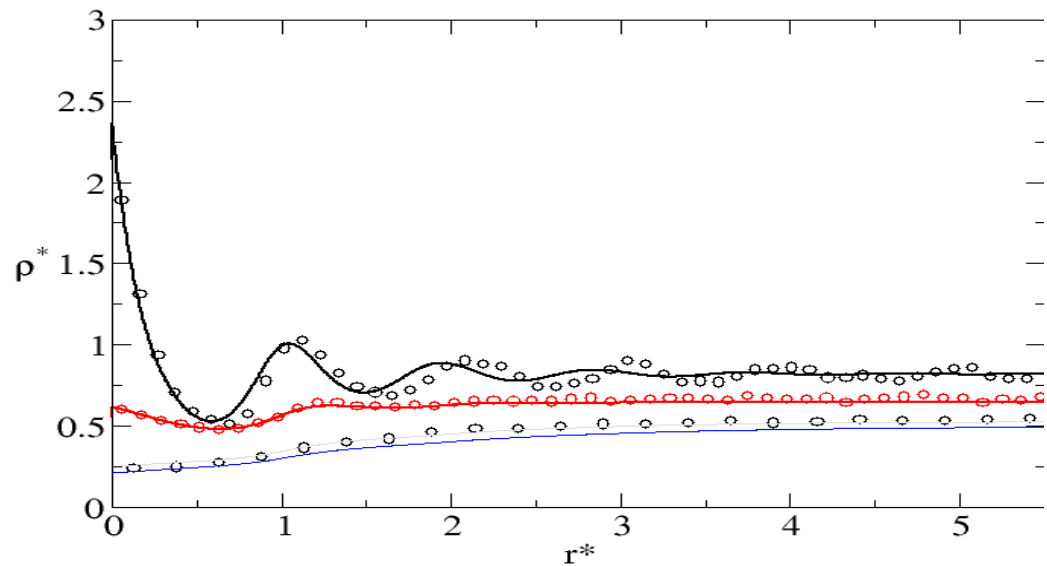

FIG. 4. (Color online) The Lindemann parameter for the bcc phase as a function of packing fraction $\bar{\eta}$ as calculated using the RSLT theory, the Tarazona theory (labeled T) and the White Bear theory (labeled WB). Both the low- α and high- α branches are shown with the stable branch being drawn with full lines and the unstable branch with dashed lines. Also shown as dotted lines are the quadratic interpolation of the curves to $L=0$ based on the data for $\bar{\eta} > 0.60$.

Applications: un fluid simple

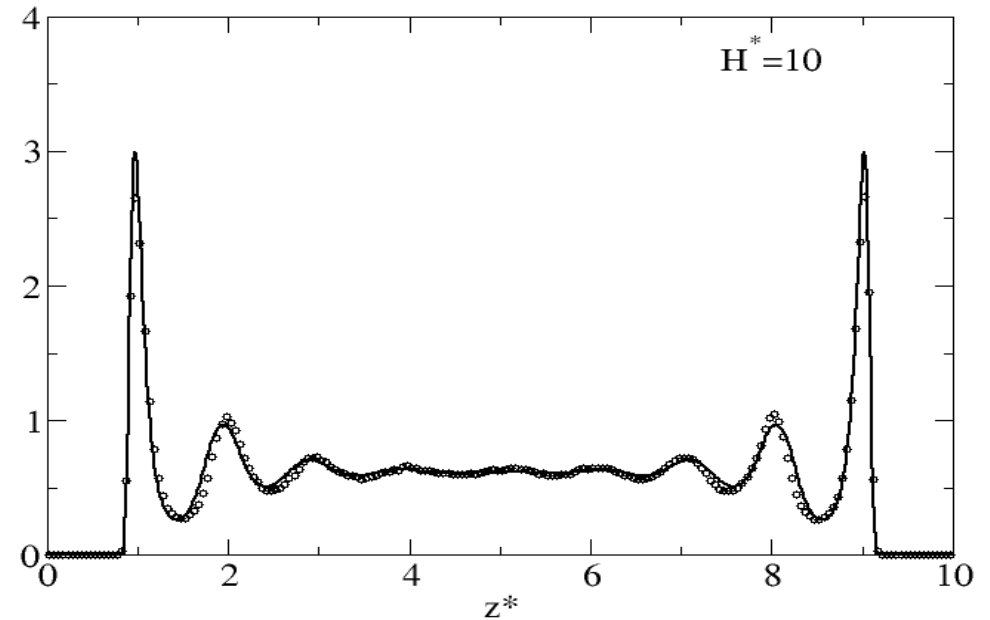

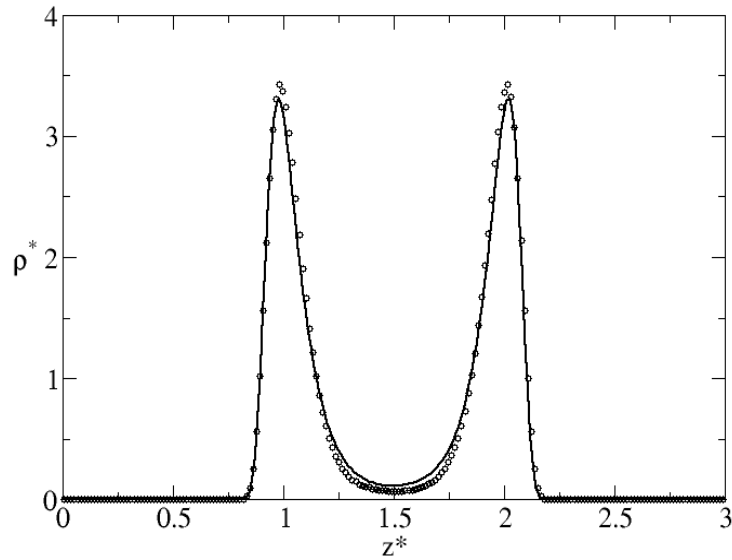

tension superficielle entre liquide et gaz

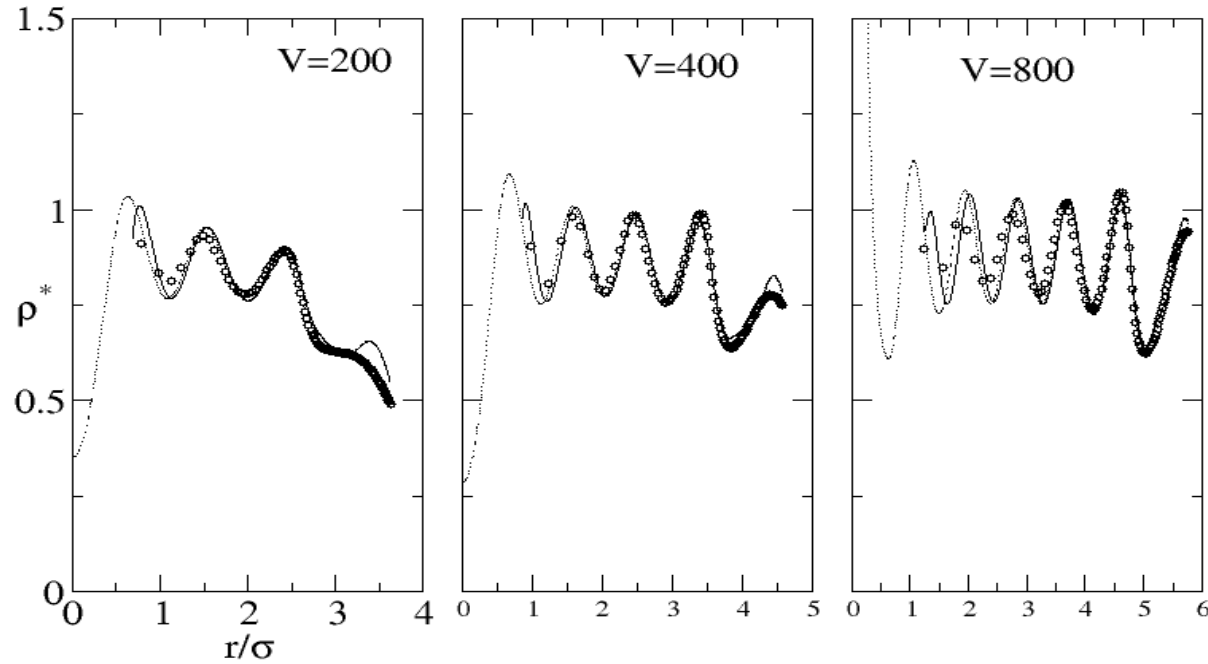

structure de près d'un mur

Applications: Slit pores (deux parois parallèles et infinie)

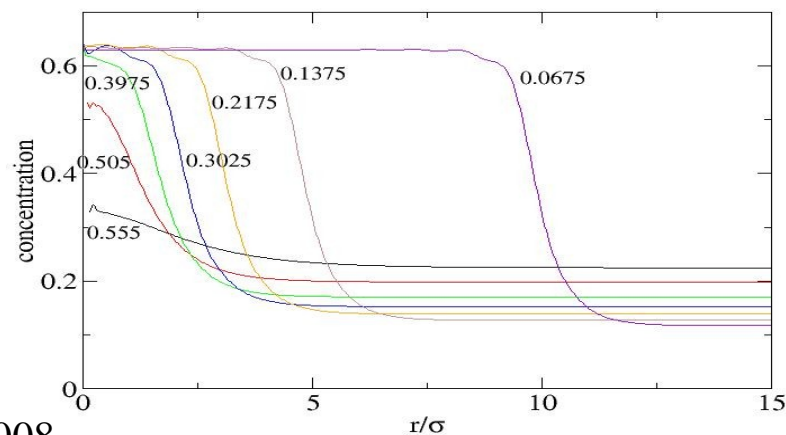

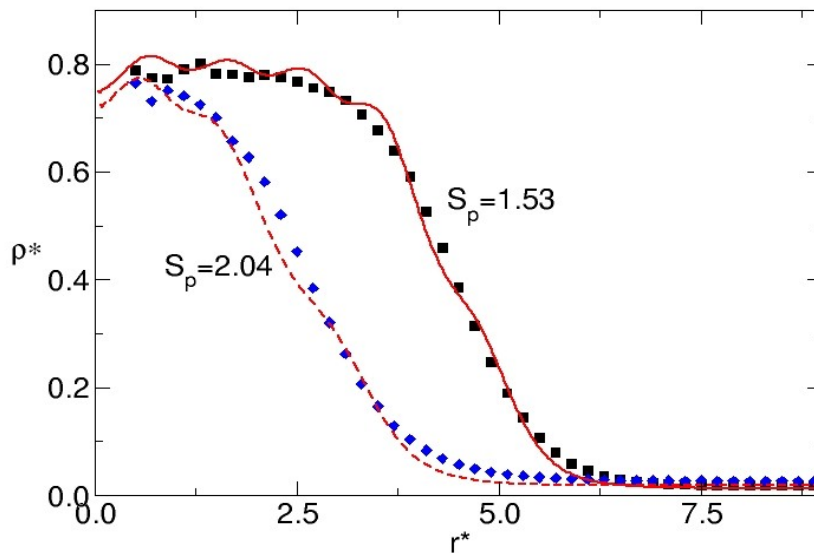

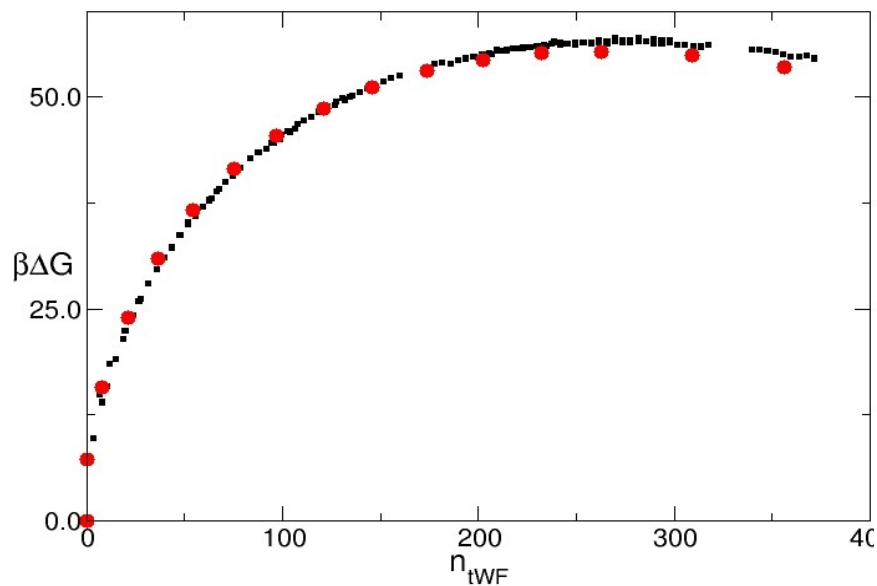

Applications: Confined Clusters

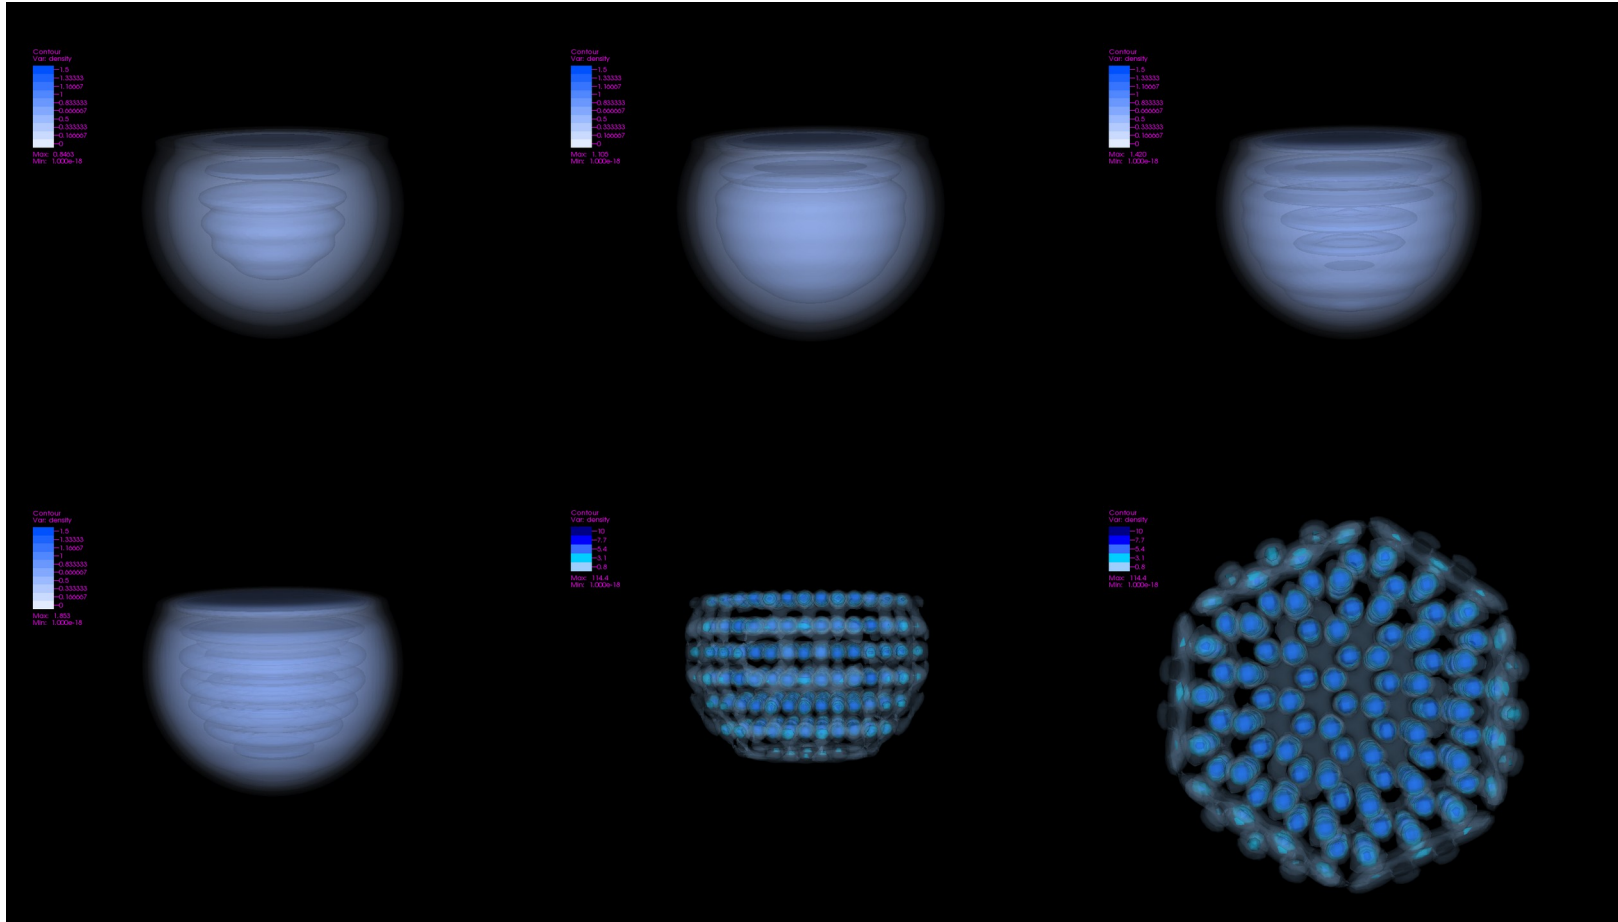

Un liquide confiné à un nano-volume sphérique

Applications: Liquid-vapor nucleation

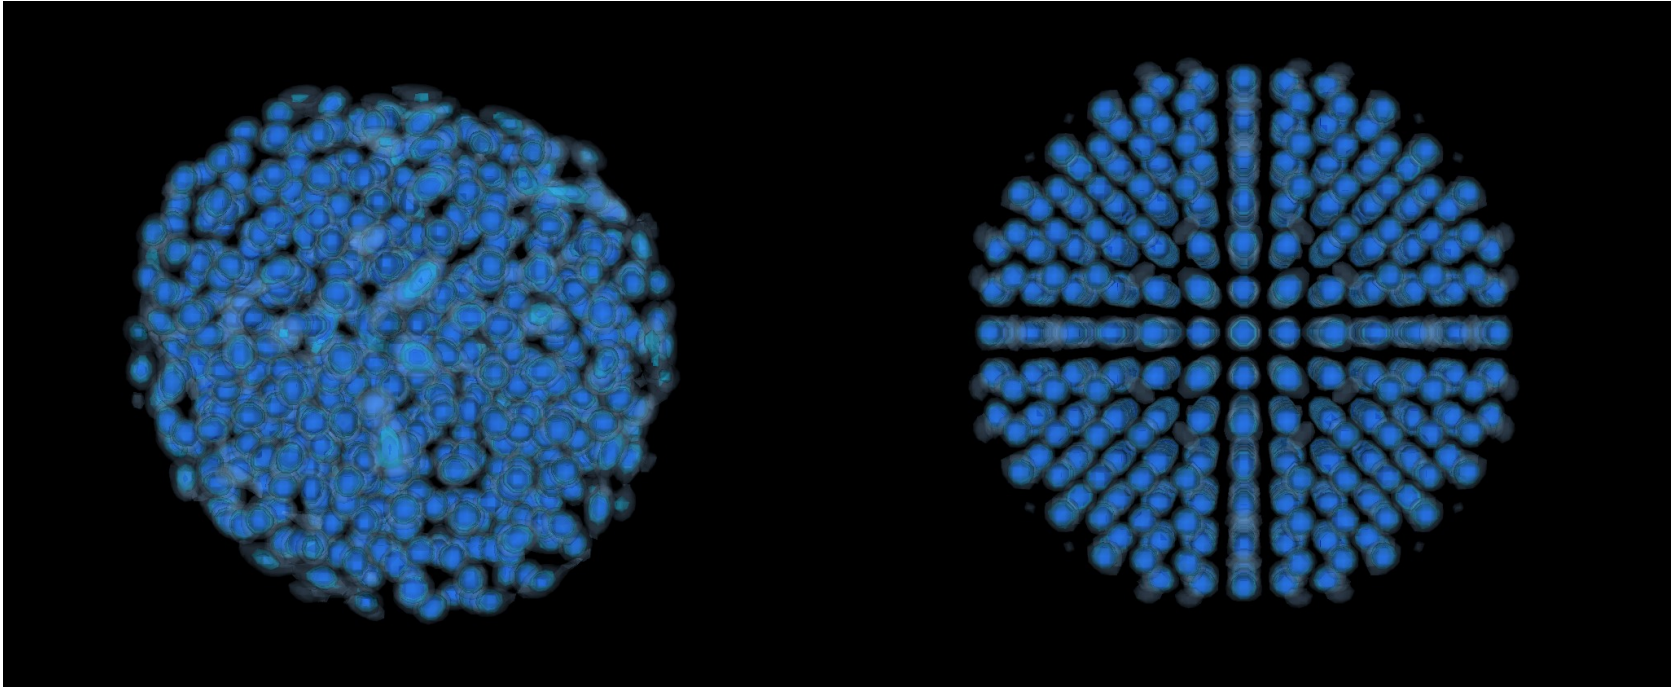

Lutsko, J. Chem. Phys., 129(124):244501+, 2008

Crystallization of cluster attached to wall

Crystalline and amorphous clusters

Applications: Protein crystallization
