NANOPHYSIQUE INTRODUCTION PHYSIQUE AUX NANOSCIENCES

Ch. 8. Stochastic Descriptions

James Lutsko

Lecture 9, 2019-2020

Stochastic Descriptions

- Mesoscopic Models: Stochastic Processes
 - Brownian Motion: Langevin Equations
 - Mean-squared displacement and fluctuations
 - Fluctuation Dissipation relation
 - Fokker-Planck equation
 - Green-Kubo relation
- Micro to Macro: Multiscale expansion
- Micro to Meso: Projection Operators
- Path probabilities and barrier crossing

Particule brownienne en suspension dans un liquide: rayon $a = 1 \mu m$. équation de Newton pour son mouvement:

$$m\frac{d^2\mathbf{r}}{dt^2} = \mathbf{F}_{\text{ext}} + \mathbf{F}_{\text{liq}}$$

1) force due à un potentiel extérieur:

$$\mathbf{F}_{\text{ext}} = -\frac{\partial U_{\text{ext}}}{\partial \mathbf{r}}$$

2) force due aux collisions avec les molécules environnantes:

$$\mathbf{F}_{\text{liq}} = -\sum_{i=1}^{N} \frac{\partial U(\mathbf{r} - \mathbf{r}_{i})}{\partial \mathbf{r}}$$

3) Approximation: Le liquide a deux effets : la particule donne énergie au liquide (*friction visqueuse*) et le liquide donne énergie à la particule (*fluctuations*) :

$$\boldsymbol{F}_{\text{liq}} = \boldsymbol{F}_{\text{visc}} + \boldsymbol{F}_{\text{fluc}}$$

D'apres Stokes:
$$F_{\text{visc}} = -mv \frac{d\mathbf{r}}{dt}$$
 $v = 6\pi a \eta$

La force des flucutations est aléatoire.

$$m\frac{d^2\mathbf{r}}{dt^2} = -\frac{\partial U_{\text{ext}}}{\partial \mathbf{r}} - m v \frac{d\mathbf{r}}{dt} + \mathbf{F}_{\text{fluc}}$$

L'équation de Newton avec cette force aléatoire ou stochastique est appelée équation de Langevin.

4) La nature de la force stochastique

Pour décrire la force stochasique, on peut invoquer le théorème central limite selon lequel une somme de nombreuses variables est une distribution gaussienne. En particulier, sa moyenne statistique s'annule:

$$\langle \boldsymbol{F}_{\text{fluc}} \rangle = 0$$

Par ailleurs, les molécules se déplacent si vite que la force à un instant donné est essentiellement indépendante de celle à un instant suivant. Ceci se traduit en disant que la fonction de corrélation statistique de la force est égale à zéro dès que $t \neq t$

$$\langle \boldsymbol{F}_{\text{fluc}}(t) \boldsymbol{F}_{\text{fluc}}(t') \rangle = 0, \quad t \neq t'$$

4) *La nature de la force stochastique*: pour élucider la nature de la force stochasique, nous étudions un système sans force exterior pour laquelle nous nous attendons le comportement diffusif.

Question: Quel est le déplacement quadratique moyenne? $\langle | \mathbf{r}(t) - \mathbf{r}(0) |^2 \rangle$

$$m\frac{d^{2}\mathbf{r}}{dt^{2}} = -m\nu\frac{d\mathbf{r}}{dt} + \mathbf{F}_{fluc}(t)$$

$$me^{\nu t}\frac{d\mathbf{r}}{dt} - me^{\nu t_{0}}\left(\frac{d\mathbf{r}}{dt}\right)_{t_{0}} = \int_{t_{0}}^{t} e^{\nu s}\mathbf{F}_{fluc}(s)ds$$

$$\mathbf{r}(t) - \mathbf{r}(t_{0}) = \nu^{-1}(1 - e^{-\nu(t - t_{0})})\mathbf{v}(t_{0}) + \frac{1}{m}\int_{t_{0}}^{t} e^{-\nu s}\int_{t_{0}}^{s} e^{\nu s'}\mathbf{F}_{fluc}(s')ds'$$

$$= \nu^{-1}(1 - e^{-\nu(t - t_{0})})\mathbf{v}(t_{0}) + \frac{1}{m\nu}\int_{t_{0}}^{t}(1 - e^{\nu(s - t)})\mathbf{F}_{fluc}(s)ds$$

$$\langle (\mathbf{r}(t) - \mathbf{r}(t_{0}))^{2}\rangle = \nu^{-2}(1 - e^{-\nu(t - t_{0})})^{2}\langle \mathbf{v}(t_{0})\mathbf{v}(t_{0})\rangle$$

$$= 0 \text{ (causality)}$$

$$\langle (\mathbf{r}(t)-\mathbf{r}(t_{0}))^{2}\rangle = \mathbf{v}^{-2}(1-e^{-\mathbf{v}(t-t_{0})})^{2}\langle \mathbf{v}(t_{0})\mathbf{v}(t_{0})\rangle + \frac{2}{m\nu^{2}}(1-e^{-\mathbf{v}(t-t_{0})})\int_{t_{0}}^{t}(1-e^{\mathbf{v}(s-t)})\langle \mathbf{F}_{\text{fluc}}(s)\cdot\mathbf{v}(t_{0})\rangle ds + \frac{1}{(m\nu)^{2}}\int_{0}^{t}ds\int_{0}^{t}ds'(1-e^{\mathbf{v}(s-t)})(1-e^{\mathbf{v}(s'-t)})\langle \mathbf{F}_{\text{fluc}}(s)\cdot\mathbf{F}_{\text{fluc}}(s')\rangle$$

4) La nature de la force stochastique:

$$\begin{split} \langle \left(\boldsymbol{r}(t) - \boldsymbol{r}(t_0) \right)^2 \rangle &= v^{-2} (1 - e^{-v(t-t_0)})^2 \langle \boldsymbol{v}(t_0) \cdot \boldsymbol{v}(t_0) \rangle \\ &+ \frac{1}{(mv)^2} \int_{t_0}^t ds \int_{t_0}^t ds' (1 - e^{v(s-t)}) (1 - e^{v(s'-t)}) \langle \boldsymbol{F}_{\text{fluc}}(s) \cdot \boldsymbol{F}_{\text{fluc}}(s') \rangle \end{split}$$

Assumer la stationnarité:

$$\langle \mathbf{F}_{\text{fluc}}(s) \mathbf{F}_{\text{fluc}}(s') \rangle = \langle \mathbf{F}_{\text{fluc}}(s+\tau) \mathbf{F}_{\text{fluc}}(s'+\tau) \rangle$$

$$\rightarrow \langle \mathbf{F}_{\text{fluc}}(s-s') \mathbf{F}_{\text{fluc}}(0) \rangle$$

$$\equiv \mathbf{\gamma}(s-s')$$

$$\langle (\mathbf{r}(t) - \mathbf{r}(t_0))^2 \rangle = v^{-2} (1 - e^{-v(t-t_0)})^2 \langle \mathbf{v}(t_0) \cdot \mathbf{v}(t_0) \rangle + \frac{1}{(mv)^2} \int_{t_0}^t ds \int_{t_0}^t ds' (1 - e^{v(s-t)}) (1 - e^{v(s'-t)}) Tr \gamma(s'-s)$$

$$= v^{-2} (1 - e^{-v(t-t_0)})^2 \langle \mathbf{v}(t_0) \cdot \mathbf{v}(t_0) \rangle \\ + \frac{1}{(mv)^2} \int_0^{t-t_0} ds \int_0^{t-t_0} ds' (1 - e^{v(s-(t-t_0))}) (1 - e^{v(s'-(t-t_0))}) Tr \mathbf{y}(s'-s)$$

4) La nature de la force stochastique:

la *stationnarité*, ⇒

$$\langle (\mathbf{r}(t) - \mathbf{r}(t_0))^2 \rangle = \mathbf{v}^{-2} (1 - e^{-\mathbf{v}(t - t_0)})^2 \langle \mathbf{v}(t_0) \cdot \mathbf{v}(t_0) \rangle$$

$$+ \frac{1}{(m \mathbf{v})^2} \int_0^{t - t_0} ds \int_0^{t - t_0} ds' (1 - e^{\mathbf{v}(s - (t - t_0))}) (1 - e^{\mathbf{v}(s' - (t - t_0))}) Tr \mathbf{y}(s' - s)$$

Le modèle le plus simple: $\langle \mathbf{F}_{fluc}(t) \mathbf{F}_{fluc}(t') \rangle = \mathbf{\gamma} \, \delta(t - t')$

$$\langle (\mathbf{r}(t) - \mathbf{r}(t_0))^2 \rangle = v^{-2} (1 - e^{-v(t - t_0)})^2 \langle \mathbf{v}(t_0) \cdot \mathbf{v}(t_0) \rangle + \frac{1}{(m \, v)^2} Tr \, \mathbf{\gamma} \int_0^{t - t_0} (1 - e^{v(s - (t - t_0))})^2 \, ds$$

$$= v^{-2} (1 - e^{-v(t - t_0)})^2 \langle \mathbf{v}(t_0) \cdot \mathbf{v}(t_0) \rangle + \frac{Tr \, \mathbf{\gamma}}{v(m \, v)^2} \left(v(t - t_0) - \frac{1}{2} (1 - e^{-v(t - t_0)}) (3 - e^{-v(t - t_0)}) \right)$$

$$\lim_{t-t_0\to\infty}\langle \left(\boldsymbol{r}(t)-\boldsymbol{r}(t_0)\right)^2\rangle = \left(\frac{Tr\,\boldsymbol{\gamma}}{\boldsymbol{\nu}(m\,\boldsymbol{\nu})^2}\right)\boldsymbol{\nu}(t-t_0)(1+\ldots)$$

4) La nature de la force stochastique

Diffusion:
$$\frac{\partial P}{\partial t} = D \nabla^2 P \rightarrow \frac{\partial \langle \mathbf{r} \cdot \mathbf{r} \rangle}{\partial t} = \int \mathbf{r} \cdot \mathbf{r} \, D \nabla^2 P \, d\mathbf{r} = 2 \, dD$$
$$2 \, dD = \lim_{t - t_0 \gg 1/\nu} \frac{\partial}{\partial t} \langle \left(\mathbf{r}(t) - \mathbf{r}(t_0) \right)^2 \rangle = Tr \, \frac{\mathbf{y}}{(m \, \nu)^2}$$

"Fluctuation-dissipation relation"

$$m\frac{d^2\mathbf{r}}{dt^2} = -mv\frac{d\mathbf{r}}{dt} + \mathbf{F}_{fluc}(t), \quad \langle \mathbf{F}_{fluc}(t)\mathbf{F}_{fluc}(t')\rangle = 2D(mv)^2 \mathbf{1}\delta(t-t')$$

Aussi,

$$\langle \frac{m}{2} \mathbf{v}(t) \cdot \mathbf{v}(t) \rangle = \frac{d}{2} k_B T \Rightarrow \frac{m}{2} Tr \mathbf{\gamma} \frac{1}{2 v m^2} = \frac{d}{2} k_B T \Rightarrow Tr \mathbf{\gamma} = 2 d v m k_B T \Rightarrow m v D = k_B T$$
"Einstein relation"

Rélation entre l'équations de Langevin et de Fokker-Planck

Question:

Y a-t-il une relation plus formelle entre la dynamique mésoscopique (équation de Langevin) et le comportement macroscopique (équation de diffusion)?

Rélation entre l'équations de Langevin et de Fokker-Planck

Equation de Langevin:
$$m \frac{dx_i}{dt} = b_i(x) + F_i(t), \quad \langle F_i(t)F_j(t') \rangle = 2D_{ij}\delta(t-t')$$

Discrétisé:

$$x_{i}(t) \rightarrow x_{i}(t_{k}) \equiv x_{i}^{k}$$

$$\frac{x_{i}^{k+1} - x_{i}^{k}}{\tau} = b_{i}(x^{K}) + F_{i}^{k}, \quad \langle F_{i}^{k}(t) F_{j}^{k'}(t') \rangle = 2D_{ij} \frac{\delta_{kk'}}{\tau}$$

 $t \rightarrow t_{\nu} = k \tau$

Distribution: $p(y;t) \equiv \langle \delta(x(t)-y) \rangle \rightarrow p(y;k) \equiv \langle \delta(x^k-y) \rangle$

Equation de Fokker-Planck:

$$\begin{split} &\frac{p(\mathbf{y};k+1) - p(\mathbf{y};k)}{\tau} = \langle \frac{\delta(\mathbf{x}^{k+1} - \mathbf{y}) - \delta(\mathbf{x}^k - \mathbf{y})}{\tau} \rangle \\ &= \langle \frac{x_i^{k+1} - x_i^k}{\tau} \frac{\partial}{\partial x_i^k} \delta(\mathbf{x}^k - \mathbf{y}) + \frac{(x_i^{k+1} - x_i^k)(x_j^{k+1} - x_j^k)}{2\tau} \frac{\partial^2}{\partial x_i^k \partial x_j^k} \delta(\mathbf{x}^k - \mathbf{y}) + \dots \rangle \\ &= -\frac{\partial}{\partial y_i} \langle \frac{x_i^{k+1} - x_i^k}{\tau} \delta(\mathbf{x}^k - \mathbf{y}) \rangle + \frac{\partial^2}{\partial y_i \partial y_j} \langle \frac{(x_i^{k+1} - x_i^k)(x_j^{k+1} - x_j^k)}{2\tau} \delta(\mathbf{x}^k - \mathbf{y}) \rangle + \dots \\ &= -\frac{\partial}{\partial y_i} \langle \left(b_i(\mathbf{x}^k) + F_i^k\right) \delta(\mathbf{x}^k - \mathbf{y}) \rangle + \frac{1}{2} \frac{\partial^2}{\partial y_i \partial y_j} \langle \left(b_i(\mathbf{x}^k) + F_i^k\right) \left(b_j(\mathbf{x}^k) + F_j^k\right) \tau \delta(\mathbf{x}^k - \mathbf{y}) \rangle + \dots \end{split}$$

Equations de Langevin et de Fokker-Planck

Equation de Langevin: $\frac{x_i^{k+1} - x_i^k}{\tau} = b_i(\mathbf{x}^k) + F_i^k, \quad \langle F_i^k F_j^{k'} \rangle = 2D_{ij} \frac{\delta_{kk'}}{\tau}$

Equation de Fokker-Planck:

$$\begin{split} \frac{p(\mathbf{y};k+1) - p(\mathbf{y};k)}{\tau} &= -\frac{\partial}{\partial y_i} \langle \left[b_i(\mathbf{x}^k) + F_i^k \right] \delta(\mathbf{x}^k - \mathbf{y}) \rangle \\ &+ \frac{1}{2} \frac{\partial^2}{\partial y_i \partial y_j} \tau \langle \left[b_i(\mathbf{x}^k) + F_i^k \right] \left[b_j(\mathbf{x}^k) + F_j^k \right] \delta(\mathbf{x}^k - \mathbf{y}) \rangle + \dots \\ &= -\frac{\partial}{\partial y_i} b_i(\mathbf{y}) \langle \delta(\mathbf{x}^k - \mathbf{y}) \rangle - \frac{\partial}{\partial y_i} \langle F_i^k \delta(\mathbf{x}^k - \mathbf{y}) \rangle \\ &+ \frac{1}{2} \frac{\partial^2}{\partial y_i \partial y_j} \tau \langle F_i^k F_j^k \delta(\mathbf{x}^k - \mathbf{y}) \rangle + \dots \end{split}$$

 \mathbf{F}^k et \mathbf{x}^k sont non corrélés à cause de causalité, ainsi $\langle \mathbf{F}^k \mathbf{x}^k \rangle = \langle \mathbf{F}^k \rangle \langle \mathbf{x}^k \rangle$, etc.

$$\frac{p(\mathbf{y};k+1)-p(\mathbf{y};k)}{\tau} = -\frac{\partial}{\partial y_i}b_i(\mathbf{y})p(\mathbf{y};k) + \frac{\partial^2}{\partial y_i\partial y_j}D_{ij}p(\mathbf{y};k) + O(\tau)$$

$$\frac{dp(\mathbf{y};t)}{dt} = -\frac{\partial}{\partial y_i} \left(b_i(\mathbf{y}) p(\mathbf{y};t) - \frac{\partial}{\partial y_j} D_{ij} p(\mathbf{y};t) \right)$$

Equations de Langevin et de Fokker-Planck

Equation de Langevin: $m \frac{dx_i}{dt} = b_i(x) + F_i(t), \quad \langle F_i(t)F_j(t') \rangle = 2D_{ij}\delta(t-t')$

Equation de Fokker-Planck:

$$\frac{dp(\mathbf{y};t)}{dt} = -\frac{\partial}{\partial y_i} \left(b_i(\mathbf{y}) p(\mathbf{y};t) - \frac{\partial}{\partial y_j} D_{ij} p(\mathbf{y};t) \right)$$

Notez: Si la dynamique déterminée est conservatrice

$$b_i(\mathbf{x}) = -K_{ij} \frac{\partial V(\mathbf{x})}{\partial X_j}$$

et s'il y a un relation fluctation-dissipation $K_{ij} = \epsilon D_{ij}$

il y a un état stationnaire.:
$$0 = -\frac{\partial}{\partial y_i} \left(-\epsilon D_{ij} \frac{\partial V}{\partial y_j} p(\mathbf{y};t) - \frac{\partial}{\partial y_j} D_{ij} p(\mathbf{y};t) \right)$$
$$= \frac{\partial}{\partial y_i} \left(\frac{\partial}{\partial y_j} D_{ij} e^{\epsilon V} p(\mathbf{y};t) \right)$$
$$\Rightarrow p(\mathbf{y}) = A e^{-\epsilon V(\mathbf{y})}$$

Fluctuation-dissipation relation <==> canonical distribution

Equations de Langevin et de Fokker-Planck

Equation de Langevin:

$$\frac{d\mathbf{r}}{dt} = \mathbf{v}$$

$$m\frac{d\mathbf{v}}{dt} = -m\mathbf{v}\mathbf{v} - \frac{\partial U_{\text{ext}}}{\partial \mathbf{r}} + \mathbf{F}_{\text{fluc}}(t), \quad \langle \mathbf{F}_{\text{fluc}}(t)\mathbf{F}_{\text{fluc}}(t') \rangle = 2D(m\mathbf{v})^2 \mathbf{1}\delta(t-t')$$

Equation de Fokker-Planck: $p(\mathbf{r}, \mathbf{v}; t)$

$$\frac{\partial p}{\partial t} + \nabla \cdot \mathbf{J} = 0 \text{ avec } J = \begin{bmatrix} \mathbf{v} \\ -\frac{1}{m} \frac{\partial U_{\text{ext}}}{\partial \mathbf{r}} - \mathbf{v} \mathbf{v} \end{bmatrix} p - \begin{bmatrix} 0 & 0 \\ 0 & D \mathbf{v}^2 \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \frac{\partial p}{\partial \mathbf{r}} \\ \frac{\partial p}{\partial \mathbf{v}} \end{bmatrix}$$
$$\frac{\partial p}{\partial t} + \frac{\partial}{\partial \mathbf{r}} \cdot \mathbf{v} p + \frac{\partial}{\partial \mathbf{v}} \cdot \left[\left(-\frac{1}{m} \frac{\partial u_{\text{ext}}}{\partial \mathbf{r}} - \mathbf{v} \mathbf{v} \right) p \right] = D \mathbf{v}^2 \frac{\partial^2 p}{\partial^2 \mathbf{v}}$$

Equation de Fokker-Planck

Equation de Fokker-Planck:
$$\frac{\partial p}{\partial t} + \frac{\partial}{\partial r} \cdot \mathbf{v} \, p + \frac{\partial}{\partial \mathbf{v}} \cdot \left| \left(-\frac{1}{m} \frac{\partial U_{\text{ext}}}{\partial r} - \mathbf{v} \, \mathbf{v} \right) p \right| = D \, \mathbf{v}^2 \frac{\partial^2 p}{\partial^2 v}$$

solution stationnaire d'équilibre: $p_{eq}(\mathbf{r}, \mathbf{v}; t) = N \exp \left[-\frac{mv^2}{2k_B T} - \frac{U_{ext}(\mathbf{r})}{k_B T} \right]$

vérification:

$$D v^{2} \frac{\partial^{2} p}{\partial^{2} v} = D v^{2} \frac{\partial}{\partial v} \cdot \left(-\frac{m v}{k_{B} T} p \right) = \frac{\partial}{\partial v} \cdot \left(-\frac{m D v}{k_{B} T} v v p \right) = \frac{\partial}{\partial v} \cdot \left(-v v p \right)$$

$$\frac{\partial}{\partial v} \cdot \left[\left(-\frac{1}{m} \frac{\partial U_{\text{ext}}}{\partial r} - v v \right) p \right] = \left(-\frac{1}{m} \frac{\partial U_{\text{ext}}}{\partial r} \right) \cdot \frac{\partial}{\partial v} + \frac{\partial}{\partial v} \cdot \left[-v v p \right] = \left(\frac{\partial}{\partial r} \frac{U_{\text{ext}}}{\partial r} \cdot \frac{v}{k_{B} T} p \right) - \frac{\partial}{\partial v} \cdot \left(v v p \right)$$

$$\frac{\partial}{\partial r} \cdot v p = \frac{-\partial U_{\text{ext}}}{\partial r} \cdot \frac{v p}{k_{B} T}$$

Equation de Fokker-Planck:
$$\frac{\partial p}{\partial t} + \frac{\partial}{\partial \mathbf{r}} \cdot \mathbf{v} \, p + \frac{\partial}{\partial \mathbf{v}} \cdot \left[\left(-\frac{1}{m} \frac{\partial U_{\text{ext}}}{\partial \mathbf{r}} - \mathbf{v} \, \mathbf{v} \right) p \right] = \frac{\mathbf{v} \, k_B T}{m} \frac{\partial^2 p}{\partial^2 v}$$

Micro to Meso: Multiscale expansion

Example: Friction et fluctuations

Nous voulons avoir une connexion plus rigorous entre la dynamique microscopique (et déterministe) et l'idée de l'équation de Langevin (description macroscopique et stochastique).

L'idée fondamentale, c'est le concept de la séparation d'échelles de temps: il y a une partie du système mésoscopique et lent et une autre partie microscopique et vite.

Nous voulons avoir une dynamique pour la partie lente dans laquelle l'effet de la partie vite donne quelque chose comme l'équation de Langevin.

Plusieurs possibilités: l'analyse multi-eschelle, l'analyse projection opérateur, ...

(d'apres Jarzynski, PRL 71, 839 (1993); Servantie et Gaspard, PRL 91 185501 (2003))

Soit un système où il y a des coordinées vite, z, et un coordiné lent, "R":

Hamiltonian: $H(\mathbf{z}; R(t)), \quad \dot{\mathbf{z}} \gg \dot{R}$

Distribution: $\rho(\mathbf{z};t,R(t))$ ensemble sur les conditions initiales

L'equation de Liouville: $\frac{\partial \rho}{\partial t} + \{\rho, H\} = 0$

Multiscale expansion: $\rho(\mathbf{z};t,R(t)) = \rho_0(\mathbf{z};R(t_1)) + \epsilon \rho_1(\mathbf{z};t,R(t_1)) + \dots$

$$t_1 = \epsilon t, \quad \epsilon \ll 1$$

Pour exemple, ε pourrait être le ratio de la masse du component vite et le component lent

$$\{\rho_0, H\} = 0, \quad O(\epsilon^0)$$

$$\frac{\partial \rho_0}{\partial R} \dot{R} + \frac{\partial \rho_1}{\partial t} + \{\rho_1, H\} = 0, \quad O(\epsilon^1)$$
etc.

(d'apres Jarzynski, PRL 71, 839 (1993); Servantie et Gaspard, PRL 91 185501 (2003))

Oth ordre:
$$\{\rho_0, H\} = 0 \rightarrow \rho_0(\mathbf{z}; R(t_1)) = f_0(H(\mathbf{z}; R(t_1)); R(t_1))$$

1 ordre:
$$\frac{\partial \rho_0}{\partial R} \dot{R} + \frac{\partial \rho_1}{\partial t} + \{\rho_1, H\} = 0 = \left(\frac{\partial f_0}{\partial R} + \frac{\partial f_0}{\partial H} \frac{\partial H}{\partial R}\right) \dot{R} + \frac{\partial \rho_1}{\partial t} + \{\rho_1, H\}$$

Multipliez par une fonction de l'energie arbitraire et intégrez:

$$0 = \int d\mathbf{z} g(H(\mathbf{z}; R(t_1)); R(t_1)) \left(\frac{\partial f_0}{\partial R} + \frac{\partial f_0}{\partial H} \frac{\partial H}{\partial R} \right) \dot{R}$$

$$+ \int d\mathbf{z} g(H(\mathbf{z}; R(t_1)); R(t_1)) \frac{\partial \rho_1}{\partial t}$$

$$+ \int d\mathbf{z} g(H(\mathbf{z}; R(t_1)); R(t_1)) \{\rho_1, H\}$$

$$= 0$$

Ceci est typique de méthodes de multiéchelle : nous trouvons des fonctions arbitraires qui sont fixées en exigeant l'élimination de termes séculaires.

$$\frac{\partial}{\partial t} \int d\mathbf{z} g(H(\mathbf{z}; R(t_1)); R(t_1)) \rho_1(H(\mathbf{z}; R(t_1)); t, R(t_1))$$

$$= -\int d\mathbf{z} g(H(\mathbf{z}; R(t_1)); R(t_1)) \left(\frac{\partial f_0}{\partial R} + \frac{\partial f_0}{\partial H} \frac{\partial H}{\partial R} \right) \dot{R}$$

"secular term'

(d'apres Jarzynski, PRL 71, 839 (1993); Servantie et Gaspard, PRL 91 185501 (2003))

$$\begin{split} 0 &= \int d\mathbf{z} g(H(\mathbf{z};R(t));R(t)) \left(\frac{\partial f_0}{\partial R} + \frac{\partial f_0}{\partial H} \frac{\partial H}{\partial R} \right) \dot{R} \\ &= \int d\mathbf{z} \int dE \ \delta(E - H(\mathbf{z};R(t))) g(H(\mathbf{z};R(t));R(t)) \left(\frac{\partial f_0}{\partial R} + \frac{\partial f_0}{\partial H} \frac{\partial H}{\partial R} \right) \dot{R} \\ &= \int dE g(E;R(t)) \left(\frac{\partial f_0(E,R)}{\partial R} \Sigma(R(t)) + \frac{\partial f_0(E,R)}{\partial E} \Sigma(R(t)) u(R) \right) \dot{R} \\ &\qquad \qquad \Sigma(E,R) = \int d\mathbf{z} \, \delta(E - H(\mathbf{z};R)) \\ u(E,R(t_1)) &\equiv \left\langle \frac{\partial H}{\partial R} \right\rangle_{(R(t_1),E)} \equiv \Sigma^{-1}(E,R(t_1)) \int d\mathbf{z} \, \frac{\partial H}{\partial R} \, \delta(E - H(\mathbf{z},R(t_1))) \end{split}$$

$$0 = \int dE \, g(E; R(t)) \left(\frac{\partial f_0(E, R)}{\partial R} + \frac{\partial f_0(E, R)}{\partial E} u(R) \right) \dot{R} \, \Sigma(R(t))$$

$$g(E)$$
 arbitraire $\rightarrow 0 = \frac{\partial f_0(E,R)}{\partial R} + \frac{\partial f_0(E,R)}{\partial E} u(R)$

(d'apres Jarzynski, PRL 71, 839 (1993); Servantie et Gaspard, PRL 91 185501 (2003))

$$0 = \frac{\partial f_0(E, R)}{\partial R} + \frac{\partial f_0(E, R)}{\partial E} u(R)$$

Solution de 1 ofte :
$$\{\rho_1, H\} = -\frac{\partial \rho_0}{\partial R} \dot{R}$$

$$= -\left(\frac{\partial f_0}{\partial H} \frac{\partial H}{\partial R} + \frac{\partial f_0}{\partial R}\right) \dot{R}$$

$$= -\left(\frac{\partial f_0}{\partial H} \frac{\partial H}{\partial R} - \frac{\partial f_0}{\partial H}u(R)\right) \dot{R}$$

$$= -\frac{\partial f_0}{\partial H} \left(\frac{\partial H}{\partial R} - u(E, R)\right) \dot{R}$$

$$\rho_1 = \rho_1^{homo} - \int_0^t dt' e^{L(t-t')} \frac{\partial f_0}{\partial H} \left(\frac{\partial H}{\partial R} - u(E, R) \right) \dot{R}$$

Évolution en arrière à temps utilisant l'Hamiltonien à R fixée.

$$\begin{split} \rho_{1}(\mathbf{z};t,R(t_{1})) &= f_{1}(H(\mathbf{z};R(t_{1}));R(t_{1})) - \int_{0}^{t}dt' \left(\frac{\partial f_{0}}{\partial H} \frac{\partial H}{\partial R} + \frac{\partial f_{0}}{\partial R}\right) \bigvee_{(\mathbf{z}(t-t'))} \dot{R}(t_{1}) \\ &= f_{1}(H(\mathbf{z};R(t_{1}));R(t_{1})) - \int_{0}^{t}dt' \frac{\partial f_{0}}{\partial H} \left(\frac{\partial H}{\partial R} - u(E,R(t_{1}))\right) \Big|_{(\mathbf{z}(t-t'))} \dot{R}(t_{1}) \end{split}$$

$$\rho_1(\mathbf{z};t,R(t_1)) = f_1(H(\mathbf{z};R(t_1));R(t_1)) - \int_0^t dt' \frac{\partial f_0}{\partial H} \left(\frac{\partial H}{\partial R} - u(E,R(t_1)) \right)_{(\mathbf{z}(t-t'))} \dot{R}(t_1)$$

(d'apres Jarzynski, PRL 71, 839 (1993); Servantie et Gaspard, PRL 91 185501 (2003))

Force movenne

Force fluctuant

$$v \approx \beta \int_{0}^{\infty} \langle F_{\text{fluc}}(t) F_{\text{fluc}}(0) \rangle dt$$

Micro to meso: Projection Operators

Dynamique microscopique Hamiltonienne

Espace des phases:
$$\Gamma = (\boldsymbol{q}, \boldsymbol{p}) = (\boldsymbol{q}_1, \boldsymbol{p}_1, \dots, \boldsymbol{q}_N, \boldsymbol{p}_N) \in M$$
, $\dim M = 2f = 2Nd$

Fonction hamiltonienne:
$$H = \sum_{i=1}^{N} \frac{p_i^2}{2 m_i} + U(\boldsymbol{q}_1, \dots, \boldsymbol{q}_N)$$

Equations d'Hamilton:
$$\dot{\boldsymbol{q}}_{i} = + \frac{\partial H}{\partial \boldsymbol{p}} \\ \dot{\boldsymbol{p}}_{i} = -\frac{\partial H}{\partial \boldsymbol{q}} \Rightarrow \{\boldsymbol{q}_{i}(t), \boldsymbol{p}_{i}(t)\} \equiv \Gamma_{t}$$

$$\frac{d}{dt}\Gamma_{t} = \{\Gamma_{t}, H(\Gamma_{t})\} \equiv L_{t}\Gamma_{t}$$

Liouville's theorem: $d\Gamma_{t_1} = d\Gamma_{t_2}$

Micro to meso: Projection Operators

Distribution

Evolution of phases

$$\Gamma(0) = \Gamma_0$$

$$\frac{d}{dt} \Gamma_t = \{ \Gamma_t, H(\Gamma_t) \} \equiv L_t \Gamma_t$$

$$\Rightarrow \Gamma_t(\Gamma_0) = e^{L_0 t} \Gamma_0$$

Probability density for initial conditions : $\rho_0(\Gamma_0)$

Average of arbitrary function of phase:

$$\langle A(\Gamma;t)\rangle = \int A(\Gamma_t(\Gamma_0))\rho_0(\Gamma_0)d\Gamma_0$$

$$\begin{split} &= \int e^{L_0 t} A(\Gamma_0) \rho_0(\Gamma_0) d\Gamma_0 \\ &= \int A(\Gamma_0) e^{-L_0 t} \rho_0(\Gamma_0) d\Gamma_0 \\ &= \int A(\Gamma) e^{-L t} \rho_0(\Gamma) d\Gamma \end{split}$$

$$= \int A(\Gamma) \rho_0(\Gamma_0(\Gamma_0)) d\Gamma_0 \\ &= \int A(\Gamma) \rho_0(\Gamma_0(\Gamma_0)) d\Gamma_0$$

Distribution:

$$\rho_{t}(\Gamma) \equiv \rho_{0}(\Gamma_{-t}(\Gamma)) = e^{-Lt} \rho_{0}(\Gamma)$$

$$\frac{\partial}{\partial t} \rho_{t}(\Gamma) = -L \rho_{t}(\Gamma)$$

Stationary (Equilibrium)

$$L \rho_t(\Gamma) = 0$$

Micro to meso: Projection Operators

Soit les variables de interet $\psi_{\alpha}(\Gamma)$, $\alpha=1,...,n\ll N$ $\Gamma=[x_i]_{i=1,...,N}$

$$\dot{\psi}_{\alpha} = L \psi_{\alpha} \Rightarrow \psi_{\alpha}(t) = e^{Lt} \psi_{\alpha}(0)$$

Ex.: Free streaming

$$\psi_{\alpha}(t) = \psi_{\alpha}(\boldsymbol{q}_{i}(0) + \boldsymbol{p}_{i}(0)t; \boldsymbol{p}_{i}(0))$$

Produit scalar

$$\langle A(\Gamma), B(\Gamma) \rangle \equiv \int A(\Gamma)B(\Gamma)\rho(\Gamma)d\Gamma, \quad L^{\dagger}\rho = -L\rho = 0$$

Projection Operator

$$PX(\Gamma) = \langle X, \psi_{\alpha} \rangle g_{\alpha\beta}^{-1} \psi_{\beta}(\Gamma), \qquad g_{\alpha\beta} \equiv \langle \psi_{\alpha}, \psi_{\beta} \rangle$$

Micro a macro: Projection Operators

$$\dot{\psi}_{\alpha} = L \, \psi_{\alpha} \Rightarrow \psi_{\alpha}(t) = e^{Lt} \, \psi_{\alpha}(0)$$

$$PX(\Gamma) = \langle X, \psi_{\alpha} \rangle g_{\alpha\beta}^{-1} \psi_{\beta}(\Gamma), \qquad g_{\alpha\beta} = \langle \psi_{\alpha}, \psi_{\beta} \rangle, \qquad Q \equiv 1 - P$$

Claim: if
$$e^{Lt} = U(t)$$
 then $U(t) \equiv e^{Lt} P + \int_0^t d\tau e^{L(t-\tau)} P L e^{L'\tau} Q + e^{L'\tau} Q$, $t \ge 0$ $L' \equiv Q L Q$

Proof: $\lim_{t \to 0} U(t) = P + Q = 1$

$$\frac{\partial}{\partial t}U(t) = Le^{Lt}P + \int_0^t d\tau Le^{L(t-\tau)}PLe^{L'\tau}Q + PLe^{L't}Q + L'e^{L't}Q$$

$$= Le^{Lt}P + L\int_0^t d\tau e^{L(t-\tau)}PLe^{L'\tau}Q + PLe^{L't}Q + QLQe^{L't}Q$$

$$= Le^{Lt}P + L\int_0^t d\tau e^{L(t-\tau)}PLe^{L'\tau}Q + PLe^{L't}Q + QLe^{L't}Q$$

$$= Le^{Lt}P + L\int_0^t d\tau e^{L(t-\tau)}PLe^{L'\tau}Q + Le^{L't}Q$$

$$= Le^{Lt}P + L\int_0^t d\tau e^{L(t-\tau)}PLe^{L'\tau}Q + Le^{L't}Q$$

$$= LU(t)$$

Micro a macro: Projection Operators

$$\begin{split} \dot{\psi}_{\alpha} &= L \, \psi_{\alpha} \Rightarrow \psi_{\alpha}(t) = e^{Lt} \, \psi_{\alpha}(0) \\ PX(\Gamma) &= \langle X, \psi_{\alpha} \rangle \, g_{\alpha\beta}^{-1} \, \psi_{\beta}(\Gamma), \qquad g_{\alpha\beta} \equiv \langle \psi_{\alpha}, \psi_{\beta} \rangle, \qquad Q \equiv 1 - P \\ e^{Lt} &= e^{Lt} \, P + \int_{0}^{t} d\tau \, e^{L(t-\tau)} P L e^{L'\tau} \, Q + e^{L't} \, Q, \qquad t \geq 0 \qquad L' \equiv Q L Q \end{split}$$

$$\begin{split} \dot{\psi}_{\alpha}(t) &= Le^{Lt}\psi_{\alpha}(0) \\ &= e^{Lt}L\psi_{\alpha}(0) \\ &= e^{Lt}PL\psi_{\alpha}(0) + \int_{0}^{t}d\tau\,e^{L(t-\tau)}PLe^{L'\tau}QL\psi_{\alpha}(0) + e^{L't}QL\psi_{\alpha}(0) \\ &= e^{Lt}\psi_{\gamma}(0)g_{\gamma\beta}^{-1}\langle\psi_{\beta}(0),L\psi_{\alpha}(0)\rangle + \int_{0}^{t}d\tau\,e^{L(t-\tau)}\psi_{\gamma}(0)g_{\gamma\beta}^{-1}\langle\psi_{\beta}Le^{L'\tau}QL\psi_{\alpha}(0)\rangle + e^{L't}QL\psi_{\alpha}(0) \\ &= -\Omega_{\alpha\gamma}\psi_{\gamma}(t) - \int_{0}^{t}d\tau\,M_{\alpha\gamma}(\tau)\psi_{\gamma}(t-\tau) + f_{\alpha}(t) \\ &= -\Omega_{\alpha\gamma}\psi_{\gamma}(t) - \int_{0}^{t}d\tau\,M_{\alpha\gamma}(\tau)\psi_{\gamma}(t-\tau) + f_{\alpha}(t) \\ &= -\Omega_{\alpha\gamma}\psi_{\gamma}(t) - \int_{0}^{t}d\tau\,M_{\alpha\gamma}(t-\tau)\psi_{\gamma}(\tau) + f_{\alpha}(t) \\ &= -\Omega_{\alpha\gamma}\psi_{\gamma}(t) - \frac{1}{2}(t-\tau)\psi_{\gamma}(t-\tau)\psi_{\gamma}(t) + \frac{1}{2}(t-\tau)\psi_{\gamma}($$

Micro a macro: Projection Operators

$$PX(\Gamma) = \langle X, \psi_{\alpha} \rangle g_{\alpha\beta}^{-1} \psi_{\beta}(\Gamma), \qquad g_{\alpha\beta} = \langle \psi_{\alpha}, \psi_{\beta} \rangle, \qquad Q \equiv 1 - P \qquad L' \equiv QLQ$$

$$\dot{\psi}_{\alpha} + \Omega_{\alpha\gamma} \psi_{\gamma}(t) + \underbrace{\int_{0}^{t} d\tau \, M_{\alpha\gamma}(t-\tau) \psi_{\gamma}(\tau)}_{\text{dissipitive term}} = \underbrace{f_{\alpha}(t)}_{\text{bruit}} \qquad \qquad \Omega_{\alpha\gamma} \equiv -g_{\gamma\beta}^{-1} \langle \psi_{\beta}, L \psi_{\alpha} \rangle \\ M_{\alpha\gamma}(\tau) \equiv -g_{\gamma\beta}^{-1} \langle \psi_{\beta} L e^{L'\tau} Q L \psi_{\alpha} \rangle \\ f_{\alpha}(t) = e^{L't} Q L \psi_{\alpha}$$

$$\langle \psi_{\alpha}, f_{\beta}(t) \rangle = \langle \psi_{\alpha}, e^{L't} Q L \psi_{\beta} \rangle = \langle \psi_{\alpha}, Q e^{L't} L \psi_{\beta} \rangle = 0 \Rightarrow f \text{ est bruit}$$

$$\langle f_{\alpha}(0) f_{\beta}(t) \rangle = \langle (QL \psi_{\alpha}) e^{L't} QL \psi_{\beta} \rangle$$

$$= \langle (L \psi_{\alpha}) e^{L't} QL \psi_{\beta} \rangle - \langle (PL \psi_{\alpha}) e^{L't} QL \psi_{\beta} \rangle$$

$$= \langle \psi_{\alpha} L^{+} e^{L't} QL \psi_{\beta} \rangle - \langle \psi_{\alpha} L \psi_{\alpha} \rangle g_{\sigma\mu}^{-1} \langle \psi_{\mu} e^{L't} QL \psi_{\beta} \rangle$$

$$= -\langle \psi_{\alpha} L e^{L't} QL \psi_{\beta} \rangle - \langle \psi_{\alpha} L \psi_{\alpha} \rangle g_{\sigma\mu}^{-1} \langle \psi_{\mu} Q e^{L't} L \psi_{\beta} \rangle$$

$$= g_{\alpha\gamma} M_{\gamma\beta}(t)$$
 "fluctuation-dissipation relation"

Local in time:

$$M_{\alpha\beta}(t) = D_{\alpha\beta}\delta(t) \Rightarrow \dot{\psi}_{\alpha} + \Omega_{\alpha\gamma}\psi_{\gamma}(t) + D_{\alpha\gamma}\psi_{\gamma}(t) = f_{\alpha}(t), \quad \langle f_{\alpha}(0)f_{\beta}(t)\rangle = g_{\alpha\gamma}D_{\gamma\beta}\delta(t)$$

Langevin dynamics:

$$\frac{d}{dt} \mathbf{q}_{i} = \mathbf{v}_{i}$$

$$\frac{d}{dt} \mathbf{v}_{i} = -\frac{\partial U(\mathbf{q}^{N})}{\partial \mathbf{q}_{i}} - \gamma \mathbf{v}_{i} + Q_{ij} \eta_{j}(t), \quad \langle \eta_{i}(t) \eta_{j}(t') \rangle = \delta_{ij} \delta(t - t')$$

Over-damped stochastic dynamics:

$$\gamma \gg 1 \Rightarrow 0 = -\frac{\partial U(\boldsymbol{q}^N)}{\partial \boldsymbol{q}_i} - \gamma \boldsymbol{v}_i + Q_{ij} \eta_j(t)$$

$$\frac{d}{dt}\boldsymbol{q}_{i} = -\gamma^{-1} \frac{\partial U(\boldsymbol{q}^{N})}{\partial \boldsymbol{q}_{i}} + \gamma^{-1} Q_{ij} \eta_{j}(t)$$

Noise probabilities:

$$P(\eta_{i}(t) = \bar{\eta}_{i}) \equiv P(\bar{\eta}_{t}) = \pi^{-1/2} e^{-\frac{\bar{\eta}^{2}}{2}}$$

$$P(\eta_{i}(t_{1}) = \bar{\eta}_{i}(t_{1}), \eta_{i}(t_{2}) = \bar{\eta}_{i}(t_{2})) = \pi^{-2/2} e^{-\frac{\bar{\eta}^{2}(t_{1}) + \bar{\eta}^{2}(t_{2})}{2}}$$

Over-damped stochastic dynamics:

$$\dot{\boldsymbol{q}}_{i}=b_{i}(\boldsymbol{q})+Q_{ij}\eta_{j}(t), \quad \langle \eta_{i}(t)\eta_{j}(t')\rangle=\delta_{ij}\delta(t-t')$$

Noise probabilities have Gaussian statistics:

$$P(\eta_i(t) = \bar{\eta}_i) \equiv P(\bar{\eta}_t) = \pi^{-1/2} e^{-\frac{\bar{\eta}^2}{2}}$$

Discretize:

$$\mathbf{q}_{i}(t+dt) = \mathbf{q}_{i}(t) + dt b_{i}(\mathbf{q}(t)) + dt Q_{ii} \eta_{i}(t)$$

Probability that positions are $q_i(t+dt)$

$$P(\mathbf{q}_{i}(t+dt)) = P(\mathbf{q}_{i}(t))P\left(\eta_{j}(t) = Q_{ji}^{-1}(\frac{\mathbf{q}_{i}(t+dt) - \mathbf{q}_{i}(t)}{dt} - b_{i}(\mathbf{q}(t)))\right)$$

Path Probabilities:
$$P(\boldsymbol{q}(t); \dot{\boldsymbol{q}}(t)) \sim \pi^{-1/2} \exp \left[-\frac{1}{2} \left[\dot{\boldsymbol{q}}_i(t) - b_i(\boldsymbol{q}) \right] Q_{ij}^{-2} \left[\dot{\boldsymbol{q}}_j(t) - b_j(\boldsymbol{q}) \right] \right]$$

$$P(\boldsymbol{q}_{0},t=0;\boldsymbol{q}_{f},t=T)=\int D\boldsymbol{q}(\tau)\exp\left[-\frac{1}{2}\int_{0}^{T}dt\left(\frac{1}{2}\left|\dot{\boldsymbol{q}}_{i}(t)-b_{i}(\boldsymbol{q})\right|Q_{ij}^{-2}\left|\dot{\boldsymbol{q}}_{j}(t)-b_{j}(\boldsymbol{q})\right|+\frac{\partial b_{i}}{\partial q_{i}}\right)\right]$$

$$\dot{\boldsymbol{q}}_{i} = b_{i}(\boldsymbol{q}) + Q_{ij} \eta_{j}(t)$$

$$P(\boldsymbol{q}_{0}, t = 0; \boldsymbol{q}_{f}, t = T) = \int D \boldsymbol{q}(\tau) \exp\left[-S_{eff}\right]$$

$$S_{eff} = -\int_{0}^{T} dt \underbrace{\left(\frac{1}{2} \left(\dot{\boldsymbol{q}}_{i}(t) - b_{i}(\boldsymbol{q})\right) Q_{ij}^{-2} \left(\dot{\boldsymbol{q}}_{j}(t) - b_{j}(\boldsymbol{q})\right) + \frac{\partial b_{i}}{\partial q_{i}}\right)}_{\text{Lagrangian } L}$$

Most likely path:

$$\frac{\delta S_{eff}}{\delta q_i(t)} = 0 \quad \Rightarrow \frac{d}{dt} \frac{\delta L}{\delta \dot{q}_i(t)} - \frac{\delta L}{\delta q_i(t)} = 0$$

$$-\frac{d}{dt}\left(Q_{kj}^{-2}\left(\dot{\boldsymbol{q}}_{j}(t)-b_{j}(\boldsymbol{q})\right)\right)-\left(\frac{\partial}{\partial q_{k}}b_{i}(\boldsymbol{q})\right)Q_{ij}^{-2}\left(\dot{\boldsymbol{q}}_{j}(t)-b_{j}(\boldsymbol{q})\right)+\frac{\partial^{2}b_{i}}{\partial q_{i}\partial q_{k}}\right)$$

$$+\frac{1}{2}\left(\dot{\boldsymbol{q}}_{i}(t)-b_{i}(\boldsymbol{q})\right)\frac{\partial Q_{ij}^{-2}}{\partial q_{k}}\left(\dot{\boldsymbol{q}}_{j}(t)-b_{j}(\boldsymbol{q})\right)+\frac{\partial b_{i}}{\partial q_{i}}=0$$

Weak noise approximation: $S_{eff} \approx -\frac{1}{2} \int_{0}^{T} dt \left(\frac{1}{2} \left(\dot{\boldsymbol{q}}_{i}(t) - b_{i}(\boldsymbol{q}) \right) Q_{ij}^{-2} \left(\dot{\boldsymbol{q}}_{j}(t) - b_{j}(\boldsymbol{q}) \right) \right)$

Most likely path:
$$-\frac{d}{dt} \left(Q_{kj}^{-2} (\dot{\boldsymbol{q}}_{j}(t) - b_{j}(\boldsymbol{q})) \right) - \left(\frac{\partial}{\partial q_{k}} b_{i}(\boldsymbol{q}) \right) Q_{ij}^{-2} (\dot{\boldsymbol{q}}_{j}(t) - b_{j}(\boldsymbol{q})) + \frac{\partial^{2} b_{i}}{\partial q_{i} \partial q_{k}} + \frac{1}{2} \left(\dot{\boldsymbol{q}}_{i}(t) - b_{i}(\boldsymbol{q}) \right) \frac{\partial Q_{ij}^{-2}}{\partial q_{k}} \left(\dot{\boldsymbol{q}}_{j}(t) - b_{j}(\boldsymbol{q}) \right) + \frac{\partial b_{i}}{\partial q_{i}} = 0$$

Weak noise approximation:
$$S_{eff} \approx -\frac{1}{2} \int_0^T dt \left(\frac{1}{2} \left(\dot{\boldsymbol{q}}_i(t) - b_i(\boldsymbol{q}) \right) Q_{ij}^{-2} \left(\dot{\boldsymbol{q}}_j(t) - b_j(\boldsymbol{q}) \right) \right)$$

Special case: crossing from a minum at A to another minimum at B

- + Conservative force: $b_i(x) = -K_{ij}(x) \frac{\partial V}{\partial x_i}$
- + weak noise approximation
- + fluctuation-dissipation relation $Q_{ij}^2(x) = \epsilon K_{ij}(x)$
